

Implementation of Klassen Typology in Mapping of Superior Commodities of Food Crops in the Malolo Agropolitan Area

Irsyadi Siradjuddin, Muhammad Anshar, Andi Idham AP.

Recording

The Zoom meeting grid displays 25 participants in a 5x5 layout. The participants are:

- 3_Arif Sofianto
- Theme 3_Irsyadi Siradjuddin
- 3_Candra_COMMITTEE
- Theme 3_Muhammad Indra ...
- Theme3_Hafzhi Nur Azmi
- Theme 3_Nofa...
- Theme 3_Nofa Martina Ari...
- Theme 3_Ari Djatmiko
- 3_Wiwin Widiastuti
- Firmansyah - theme 3
- 3_Holi B. Wijaya
- theme 3_Atma Rulin
- Theme 3_Eny Farida Nurha...
- 3_SALSABILLA SAVITRI_CO...
- 3_Utari Vipriyanti
- Theme 3_Novia Purbasari

- 3_Marwoto
- Theme 3_Mustovia Baperli...
- Theme3_Februhardi_Bapp...
- Theme3_wahyudi
- 3_Soedwiw

Several participants have shared slides titled "The 4th GEOPLANNING" with sub-headers: "Generalized Techniques Spatial Planning and Regional Development in Pandemic Era".

Chat

From 3_Holi B. Wijaya to Everyone: 04:05 PM

Q to Pak Arif Sofianto, What kind of BUMDes business that can survive while in Pandemic time, and what are the most important factors for success story, thanks.

From 3_Holi B. Wijaya to Everyone: 04:18 PM

Q to Pak Irsyadi Siradjuddin, from your analysis experience, what are the advantage and limitation of Klassen mapping to analyze the agropolitan development, thanks.

From 3_Holi B. Wijaya to Everyone: 04:26 PM

Q to Bu Wiwin, are there any MSME Bussiness that could survive or even grow while in pandemic era? if yes or no why?, many thanks.

Held by:

The 4th GEOPLANNING

International Conference of Geomatics and Planning

**Geospatial Technologies, Spatial Planning, and
Regional Development in Pandemic Era**

Virtual Conference, 25 - 26 August 2021

Sub- Theme:

- 1 Application of Geospatial Technology
- 2 Urban and Regional Resilience
- 3 Regional and Rural Development
- 4 Urban and Regional Infrastructures

ABOUT GEOPLANNING CONFERENCE

The Geoplanning International Conference focuses on scientific works in the field of applied geomatics' technologies for Urban & Regional planning and Development. The conference invites keynote speakers having international reputations and “calls for papers” to academics, researchers, professionals from universities, governments, private sectors, industries and other institutions to deliver their paper on the topics appropriate with the assigned themes and issues at that moment. In The 4th Geoplanning – International Conference on Geomatics and Planning 2021, the major issue determined is The Challenges of Pandemic Era:

“Geospatial Technologies, Spatial Planning, and Regional Development in Pandemic Era”.

Theme 1: Application of Geospatial Technology

Theme 2: Urban and Regional Resilience

Theme 3: Regional and Rural Development

Theme 4: Urban and Regional Infrastructures

You are cordially invited to participate in the 4th Geoplanning – International Conference on Geomatics and Planning, which will be held on August 25-26th, 2021. If you are willing to submit your paper, please submit your abstract first. After the acceptance's decision, you will be asked to complete the registration. When it is accomplished, we will send you an-ID and Password, using which you can submit your full paper. We wish you all the best for this conference and hope that it will provide you every opportunity for dialogue with colleagues from around the corner and around the world.

INDEXING

The Geoplanning Journal is indexed by:

- Scopus
- DOAJ (Directory of Open Access Journal)
- EBSCO host
- SINTA (Score: S1)
- Indonesia Publication Index (IPI)

JOURNAL AIMS AND SCOPE

Geoplanning: Journal of Geomatics and Planning is a scientific journal (e-journal & Open Access) focusing on the scientific works in the field of applied geomatics technologies for urban and regional planning including GIS, Remote Sensing and Satellite Image Processing. It provides article relating to spatial planning like Urban and Regional Planning, Environmental Planning, Disaster and Mitigation Planning, Climate Change and Land use Planning, Coastal Planning, and Development Management.

CONFERENCE SPEAKERS

1. Ganjar Pranowo, S.H., M.I.P. (Governor of Central Java)
2. Dr. Prasetyo Aribowo, SH, M. Soc. Sc (Planning and Development Agency of Central Java)
3. Prof. Dr.rer.nat Muh Aris Marfai (Head of Geospatial Information Agency)
4. Prof. Dr. Walter Timo de Vries (Technical University of Munich, Germany)
5. Prof. Beniamino Murgante, Ph. D (University de Bassilicata, Italy)
6. Assoc. Prof. Dr. Sc. Agr. Iwan Rudiarto (Diponegoro University, Indonesia)

ORGANIZING COMMITTEE

1. Prof. Dr.rer.nat. Imam Buchori – Diponegoro University
2. Prof. Agus Hermawan, Ph.D – HIMPENINDO
3. Dr. Senen Budi P., SE, M.Si. - Regional Planning Research and Development Agency (Bappeda) of Central Java Province
4. Prof. Dr. Walter Timo de Vries – TU Munich, Germany
5. Prof. Beniamino Murgante, Ph. D – University de Basilicata, Italy
6. Dr. Anang Wahyu Sejati – Diponegoro University
7. Dr. Yudi Basuki – Diponegoro University
8. Dr. Holi Bina Wijaya, MUM – Diponegoro University
9. Dr. Eng. Maryono – Diponegoro University

SECRETARIAT

FOREWORD

Greetings from

Regional Planning Research and Development Agency of Central Java Province

It is our pleasure to welcome you to the 2021 International Conference “**Geospatial Technologies, Spatial Planning, and Regional Development in Pandemic Era**” in Semarang, Indonesia. This international conference is organized by Regional Planning Research and Development Agency (Bappeda) of Central Java, in cooperation with Diponegoro University and Indonesian Researcher Association (Himpenindo) of Central Java. A major goal and feature of it is to provide a platform for the exchange of knowledge, information and experience on Geospatial data, Spatial Planning, and Regional Development during the pandemic outbreak at the local, national, and international level.

Since the release in early 2020, all countries have been challenged by the novel coronavirus. It presents tough choices for the entire elements of stakeholders to respond chaotic and unpredictable effects in a controlled way. It is now widely recognized that the Pandemic triggered the most serious crisis in multisector. Some innovation has been initiated to respond this pandemic outbreak. The geographic information and technology contribute into Covid pandemic surveillance, modelling, and response enhances understanding to control the disease. Geospatial Data and Technology was applied in providing visualizations of the spread of disease in local communities, provinces, states, countries, and worldwide. It helps to monitor and control infections and help treat or support medical staff. Therefore, Geospatial data, Spatial Planning, and Regional Development play a critical role in understanding and responding to the Covid pandemic.

The conference consists of invited sessions, and technical workshops and discussions with speakers covering a wide range of topics in Geospatial data, Spatial Planning, and Regional Development. It provides all attendees with the opportunities to meet and interact with one another virtually. We hope your experience with the 2021 International Conference “**Geospatial Technologies, Spatial Planning, and Regional Development in Pandemic Era**” is a fruitful and long lasting one. With your support and participation, the conference will continue its success for a long time.

The conference program represents the efforts of many people. We would like to express our gratitude and appreciation to all partners, i.e. the committee, speakers and presenters, and all participants who have been participated in this international Conference. May the conference be beneficial to all of us.

Semarang, 25th August 2021

Dr. PRASETYO ARIBOWO, SH, M.Soc.Sc
The Committee of International Conference

CONFERENCE PROGRAM

GENERAL GUIDELINES

For all presenters and attendees, please keep the following points in mind:

1. All participants will be accessed through the ZOOM Cloud Meetings. A few minutes prior to the start of the conference, a 'Join Now' button will appear next to the session title in the program. By clicking this button and entering a password, to be sent to all registrants a few days before the conference, you will be added to the room.
2. You must have a computer with a webcam and microphone, a strong internet connection, and the latest version of Zoom downloaded on your device before the live session.
3. You have to use the provided virtual background and write your name in the format: Name_Panel Number.
4. All participants will be directed to the break room based on the selected panel and cannot enter the other panels. You can watch other panel presentations on youtube channel: http://tiny.cc/Live_4thGeoplanning.
5. All participants are requested to fill in attendance form at the provided link.
6. The presentation video will be shown for less than 8 minutes.
7. Question and answer session should be no more than 4 minutes. For those of attendees who want to ask questions, the Q&A Box has been provided. The moderator will ask the question to the presenter.
8. We value the participation of each member of the community and endeavor to deliver an enjoyable and fulfilling experience. Conference participants are expected to conduct themselves with integrity, courtesy and respect for others and maintain the highest level of professionalism at the conference.
9. Disruptions that interfere with the conference experience for other attendees are not permitted.
10. Our conference is dedicated to providing a harassment-free conference experience for everyone, regardless of gender, gender identity and expression, age, sexual orientation, disability, physical appearance, body size, race, ethnicity, religion, or technology choices.

Rearrangement of Government Policies and Regional Revenue Potential for Funeral Spatial

Andjar Prasetyo

RnD Agency of Magelang City, Indonesia

Problems in Funeral Governance that were found were limited land for cemeteries, difficulty in land acquisition in urban areas. This condition is related to the spatial area of an area. In burying the family of the deceased creates problems, it is even found in big cities by piling one burrow with family members who have been buried previously. On the other hand, there are many private groups that make commercial use of funerals that the lower classes cannot access. The purpose of this study is to explore and evaluate various burial problems, evaluate and analyze funeral problems in the perspective of regional economic policy. The locations were conducted in several cities with quantitative and qualitative descriptions based on the interview process in the private and public sectors. The results indicate that there is a need for policies to readjust to existing regulations and the potential for structuring local revenues for private sector funerals.

Keywords: Governance Policy, Private Sector Funeral, Spatial Area, Regional Economy

Improving Toddler Health Monitoring and Economic Efficiency with Spatial and Information Technology Approaches in the Covid-19 Pandemic

Bekti Putri Harwijayanti

Midwifery Study Program of Blora, Health Polytechnic of Semarang, Indonesia

This study purpose to develop a tool for monitoring toddler's growth and development in a sub-district area limitation. Monitoring activity was carried out by involving mothers independently as a substitute for integrated health service posts. Economic efficiency analysis was performed by web based- information approach. After being implemented, following points were obtained through online applications during the COVID-19 pandemic period: participation level of mothers with toddlers in using online applications and descriptions of toddler growth and development. Primary data gained from respondents' input in the application while secondary data came from the Public Health Center. Study was conducted in Magelang City and Blora Regency, Central Java Province, Indonesia. The data were analyzed by Ishikawa diagrams. By building a web-based online application through a spatial approach, the results showed: monitoring the growth and development of toddlers in COVID-19 pandemic could still be done, has economic efficiency, meanwhile it was found the level of public readiness for the use of web-based information technology within a spatial framework.

Keywords: Toddler Growth, Economic Efficiency, Integrated Health Service Posts

ConTraSis: The Congested Traffic Impact Analysis During the Large-Scale Social Restrictions of COVID-19 in West Java Province, Indonesia

Risnandar and Dewi Gartika

1) Department of Informatics Engineering, School of Computing, Telkom University, Bandung, Indonesia and the Research Center for Informatics, Indonesian Institute of Sciences/the National Research and Innovation Agency of Republic Indonesia Bandung, Indonesia

2) Research and Development Agency West Java Province, Bandung, Indonesia, Indonesia.

In some metropolitan cities of West Java Province, the urban mobility affects to the congested traffic. This study analyses the congested traffic during the large-scale social restrictions of COVID-19 around some metropolitan cities of West Java Province in May-August 2020. The national government of the Republic of Indonesia declared a national's large-scale social restrictions of COVID-19 with only some essential traffic being allowed to operate. Our proposed method, namely, ConTraSis is contributed to analyze the congested traffic per month from May-August 2020. We exploit the Geomatic of the congested traffic in the PIKOBAR dataset for Bogor, Depok, and Bekasi (Bodebek area); Bandung area; and whole West Java Province areas. The ConTraSis demonstrates that the congested traffic during the large-scale social restrictions of COVID-19 reduces around 18%-49% every month. Instead, the West Java government always launch the many good governance policies to support the large-scale social restrictions of the COVID-19 system.

Keywords: The Congested Traffic, Large-Scale Social Restriction, Covid-19, West Java, PIKOBAR, Geomatic

Potensial of Natural Tourism in Karawang Regency, West Java Province

Nisrina Maliha

University of Indonesia, Indonesia

Karawang is one of the regencies in Indonesia that is trying to develop the tourism sector. The tourism potential in Karawang Regency is very interesting and is rarely known by the public, so the obstacles faced are the tourism potential that has not been explored much to bring tourists to visit the area's tourist attractions. The very wide area of Karawang provides a potential for natural tourism such as waterfalls, beaches, lakes and mountains. This study aims to determine the potential for natural tourism in Karawang Regency and to determine the relationship between potential tourist objects and the number of visitors in Karawang Regency. The analytical method used is spatial descriptive method and using the Chi Square Statistic Test to find the relationship between tourism potential and the number of tourists. The results showed that the high potential of natural attractions can be seen from the diversity of site attractions and the presence of event attractions. Equipped with the availability of complete facilities, accessibility that can be easily reviewed and the large number of tourists visiting. Meanwhile, the low potential of natural tourism objects can be seen from the non-diversity of primary facilities and the lack of availability of secondary facilities as well as conditional facilities. Access to tourist destinations is inadequate and a small number of tourists visit. Through the results of statistical tests, there is a relationship between the potential for natural tourism and the number of visitors to natural attractions in 2019 in Karawang Regency.

Keywords: Potential of Natural Tourism, Natural Attraction, Number of Tourists

Multi temporal Remote Sensing Data for Mapping Urban Built-Up

Anis Kamilah Hayati, Yohanes Fridolin Hestrio, Niko Cendiana

National Institute of Aeronautics and Space of Indonesia, Indonesia

Remote sensing data analysis in the cloudy area is still a challenging process. Fortunately, remote sensing technology is fast growing. As a result, multi temporal data could be used to overcome the problem of the cloudy area. Using multi temporal data is a common approach to address the cloud problem. However, most methods only use two data, one as the main data and the other as complementary of the cloudy area. In this paper, a method to harness multi temporal remote sensing data for automatically extracting some indices is proposed. In this method, the process of extracting the indices is done without having to mask the cloud. Those indices could be further used for many applications such as the classification of urban built-up. Landsat-8 data that is acquired during 2019 are stacked, therefore each pixel at the same position creates a list. From each list, indices are extracted. In this case, NDVI, NDBI, and NDWI are used to mapping built-up areas. Furthermore, extracted indices are divided into three categories by their value (median, quantile 75, and maximum) to see which produce better accuracy. The Pleiades as high-resolution remote sensing data is used as a reference for assessment.

Keywords: Built-up, Multi temporal, Indices, Remote Sensing, Mapping

Spatial model to determine environment-based disease vulnerability zones Case study: Leptospirosis vulnerability Zone in Bantul District

Sunaryo, Dewi Marbawati, Bina Ikawati

Banjarnegara Health Research and Development Unit, Indonesia

Leptospirosis is a zoonosis disease caused by *Leptospira* bacteria, transmitted through skin wounds or mucous with water or soil contaminated with leptospires from animal urine especially rodents. This paper aims to map spatially the distribution of leptospirosis and to determine a model of leptospirosis-vulnerability areas based on environment variables using the Geographic Information System. The method used was making a zoning map based on the scoring and weighting of the environmental risk variables for leptospirosis transmission. The spatial distribution of leptospirosis cases in the Bantul District in recent years is evenly distributed in each Sub District, but clusters are formed in the central area with lowlands. Leptospirosis- vulnerability zones are in areas dominated by technical irrigated rice fields.

Keywords: Spatial, Leptospirosis, Vulnerability Model

Space Usage Study of Galesong Beach Boundary Area

Arif Isnaeni, Arief Hidayat

IAP Sulawesi Selatan, Universitas Teknologi Sulawesi, Tokyo University of Science, Indonesia

The coastal area has huge potential that is utilized by fishermen to fulfill their daily needs. Coastal area also has a big potential purpose being transportation, trade, tourism and supporting accommodation facilities services, and various socio-economic activities for the community in coastal terms. In the condition of spatial use of the Galesong coastal boundary area, it has a limit to developing in economic activities instead of for nature conservation zone. The purpose of this research is to analyze the use of space in the coastal boundary area of Galesong Beach, by reviewing the socio-cultural aspects, the characteristics of the coastal area, and the application of region spatial law regulation. The result shows the maximum threshold of the development activity is 6% or 13.68 Ha of the total area of the coastal boundary area. This result is still allowed for the development of economic activities in accordance with the general provisions of district zoning regulations of the Galesong boundary area. The result includes in the two categories such as typology 2 (there is an overdraft that is not according to its designation) and typology 4 (not yet built).

Keywords: Spatial, Usage, Coastal, Boundary, Development

Analysis of mangrove ecotourism suitability in Cilebar and Tempuran Sub-Districts, Karawang Regency, Indonesia

Luthfiyyah Dzakiyyah Wopa

Department of Geography, Faculty of Mathematics and Natural Science, Universitas Indonesia, Depok, 16424, Indonesia, Indonesia

Mangrove ecotourism is a form of sustainable tourism that supports conservation and increases the income of local communities. Cilebar sub-district includes Pusakajaya Utara Village and Mekarpohaci Village; and Tempuran sub-district includes Tanjungjaya Village and Sumberjaya Village, Karawang Regency are 4 villages that have mangrove ecotourism potential. This study aims to identify the potential for mangrove ecotourism and to analyze the level of land suitability for ecotourism development in the coastal villages of Cilebar and Tempuran Sub-Districts. The method used in this research is descriptive quantitative with data through field surveys and literature studies. Determination of the sample points using purposive sampling method which represents each classification of mangrove density based on the use of remote sensing. the parameters used are the biophysical conditions of mangrove forests includes mangrove thickness, mangrove density, mangrove species, biota objects, tides, conservation, and accessibility. The results of this study indicate that the tourism suitability index (TSI) is 75% for the coast of Pusakajaya Utara Village, 55.67% for the coast of Mekarpohaci Village, 63.50% for the coastal in Tanjungjaya Village, and 71.33% for Sumberjaya Village. This study concludes that the coastal of Cilebar and Tempuran Sub-Districts have 2 classifications of potential suitability for mangrove ecotourism. The suitable classification is found in Pusakaya Utara, Tanjungjaya, and Sumberjaya Village, while the conditional classification is found in Mekarpohaci Village.

Keywords: Coastal, Ecotourism, Mangrove, Remote Sensing, Suitability.

The Vulnerability of Slum toward Fire Disaster in Krian Sub-District

Linda Dwi Rohmadiani and Muftiatus Sahliyah

Universitas PGRI Adi Buana Surabaya, Indonesia

Krian district is in the first place of fire history in Sidoarjo Regency with 21 or 17% incidents. Based on the results of research in 2020, Krian subdistrict is included in the category of slum delineation areas based on the implementation of the KOTAKU program with a moderate slum level of 12 RT (Neighborhood) or 30%, 28 RT or 70% of light slums. This research aimed to analyze the level of vulnerability of the slums in Krian subdistrict to fire disasters. The method used in this research was the scoring method, overlay union, and qualitative descriptive. The results showed that the slum settlements in Krian Subdistrict were 12 RT or 100% had a moderate level of vulnerability to fire disasters with a score of 21-28.

Keywords: Fire Disaster Vulnerability, Fire Suppression, Slums

Potential of Village-Owned Enterprises (BUMDes) for Rural Economic Recovery During the Covid-19 Pandemic in Central Java

Arif Sofianto

Bappeda Provinsi Jawa Tengah, Indonesia

For several years the Government of Indonesia has been initiating the growth of Village-Owned Enterprises (BUMDes), economic institutions that manage the village's economic resources. The Central Java Provincial Government also provides incentives to establish BUMDes in most villages in Central Java. During the Covid 19 pandemic, some rural communities were affected, and the village economy stagnated. BUMDes is one of the village economic institutions that is expected to be able to drive the village economy in the era of the Covid 19 pandemic. This study aims to analyze the potential of BUMDes as a solution to handling the impact of the Covid 19 pandemic in rural areas, especially from an economic aspect in Centra Java. This type of research is descriptive with the main qualitative approach assisted by quantitative (mixed method). The research technique used was a survey involving 337 villages. Respondents came from elements of village officials and BUMDes managers. The instrument used was a semi-closed questionnaire distributed through online media (google form). Data analysis used descriptive statistical techniques in the form of means and percentages. The conclusion of this study shows that BUMDes have the potential to play a role in economic recovery, but this function is not yet optimal. The function of BUMDes has not been optimal because the business sector managed by BUMDes is not based on the village's superior potential, as well as the lack of a business development concept, weak human resource and capital capacity, and weak networks

Keywords: Rural, BUMDes, the covid-19 pandemic, Central Java

Analysis of Urban Heat Island Phenomenon Toward Land Cover Areas as A Global Warming Control Based on Remote Sensing In Jember Regency

Ratih Novi Listyawati and Prasetyo

Universitas Jember, Politeknik Negeri Malang, Indonesia

Global warming is a worldwide problem because it has a major impact on the sustainability of the earth. One of the causes is the Urban Heat Island (UHI) phenomenon. The effects of global warming can be controlled with various strategies, for example by controlling land cover so that it can bring balance to ecosystems and environmental quality. Jember Regency has a relatively high population growth rate. Total population growth per year is 0.55% in 2020. The increase of developed land is a result of the enhancement of urban residents and can generate surface temperature which can produce the urban heat island phenomenon. This research aims to analyze the UHI phenomenon in 3 sub-districts in Jember Regency using the Landsat 8 OLI remote sensing image processing method and Multispectral Imagery TIRS to obtain surface temperature values and high-resolution aerial photos in 2020 which will be used in identifying surface land use through several extractions, namely utilization of supervised classification, NDVI (Normalized Difference Vegetation Index) and LST (Land Surface Temperature). The results showed that the increase in surface temperature values occurred periodically through 15 years, where the spatial distribution of the highest temperature was in the city center. The increase in Urban Heat Island phenomenon in Jember Regency is inversely proportional to changes in open space and is directly proportional to the escalation in building density.

Keywords: Urban Heat Island, Landsat Image, Land Cover

Three-dimensional Line Mapping from Airborne Digital Photogrammetry for Detail Spatial Planning

Budhy Soeksmantono and D. Muhally Hakim

Institute of Technology Bandung, Indonesia

Government regulation mentioned that detail spatial planning has to use detailed map data, which mean detail thematic information with high accuracy in term of geometric aspect. Three-dimensional (3D) representation of city infrastructures needs to fulfill due to the spatial planning office application to organize their city, for example building permit purpose. This kind of data is very useful for another spatial analysis and application as well, such as smart city and digital twin. The utilization of digital technology to streamline a long-standing business workflow is an issue in various fields in recent years, including geospatial technology for city planning. Currently, the development of large format digital camera and photogrammetric workflow has experienced rapid progress. City infrastructures such as building, sewerage and gutter, roads, electricity poles, etc. is possible to be extracted accurately including their position, shape and dimension with this mapping technique. This paper presents the creation of high accuracy three-dimensional line map derived from digital photogrammetric workflow for Bandung City as a study area. This area has ramps characterized in the southern part and hilly terrain in the northern part where height discrepancies between those two areas are approximately one thousand five hundred meters. It is a challenge to meet high accuracy spatial data for the whole areas with this condition. Validation of positional accuracy was carried out using hundreds pre-marking independent check points (ICP) and well identified geographic features as an addition. The result show that almost all city infrastructures on the terrain can be identified and positional accuracy in centimeter level can be obtained by this technique.

Keywords: 3D, photogrammetry, Spatial Planning

Community Empowerment in Handling Stunting in Wonogiri Regency Through "Sego Sak Ceting"

Lilyk Eka Suranny

Bappeda dan Litbang Kabupaten Wonogiri, Indonesia

The prevalence of stunting in Wonogiri Regency is still quite high. The factors that cause stunting include the lack of food availability in the household and the mother's knowledge of good nutrition during pregnancy and child birth. One of the stunting prevention programs in Wonogiri Regency is through community empowerment known as "Sego Sak Ceting"(Sesarengan Wargo Beraksi Cegah Stunting). This activity was initiated by Puskesmas Giriwoyo I, Wonogiri. SeGo Sak Ceting program is focused on improving household food availability as well as increasing maternal knowledge about good nutrition during pregnancy and childbirth. The objectives of this study were (1) to determine the stages of community empowerment activities through SeGo Sak Ceting and(2) to determine the effectiveness of the program in the context of reducing stunting in Wonogiri. The data collection was conducted by doing observation, interviews, and literature study, and the data analysis was the qualitative descriptive analysis. The results showed that the stages of community empowerment activities through sego sak ceting, namely socialization of the program to the target community; implementation of activities as well as monitoring and evaluation of the implementation of activities. Community empowerment through "Sego Sak Ceting" has succeeded in: (1) reducing the percentage of pregnant women with Chronic Energy Deficiency (CED) from 9.5% to 5.42%; (2) reducing the percentage of Low Birth Weight (LBW) from 5.2% to 3%; (3) increasing the percentage of participation of pregnant women in the class of pregnant women from 82.48% to 85.10%; (4) increasing the percentage of attendance of mothers having a toddler to posyandu from 82.48% to 85.10%.

Keywords: Empowerment, Stunting, "Sego Sak Ceting"

How Is the Potential Land for The Development of The Central Government Area of West Java Province? Anticipate the Development of The City of Bandung

Ari Djatmiko, Gerry Andrika Rismana, Aurellia Faneska

Pasundan University, Bandung, Indonesia

The Central Government Area is one of the vital components in a government activity, both at the central and regional levels. The current state of the center of West Java Province government is located in Bandung City with a very high level of urban development and population density (BPS Provinsi Jawa Barat, 2020). The intensity of city activities and the density of the people makes Bandung City no longer physically suitable in supporting the activities of the central government (Kompas, 2019). This study aims to assess the potential land designation of the central government area of West Java Province with the study location in Cikalongwetan District, West Bandung Regency. This study contains methods and results that are relatively rarely used in previous studies related to the carrying capacity of central government areas, namely the use of parameters for consideration of geological aspects and the use of existing spatial patterns and land use plans in determining land potential. Assessment of potential land is carried out using the physical land carrying capacity and land balance approach. Based on the assessment carried out, it can be concluded that there are 5 (five) villages in Cikalongwetan District that have a potential category as a candidate for the location of the Central Government Area of West Java Province. These villages are: Kanangsari Village, Mandalamukti Village, Mandalasari Village, Puteran Village, and Tenjolaut Village.

Keywords: Central Government Areas, Potential Land, Land Balance, Physical City, Carrying capacity.

Geospatial Application and Utilisation of SPOT Imagery for the Detection of Coastline Displacement in Bireuen Regency, Aceh Province, and North Gorontalo Regency, Gorontalo Province.

Eka Djunarsjah, Miga Magenika Julian, Nafandra Syabana Lubis, Andika Permadi Putra

Bandung Institute of Technology, Indonesia

As an archipelagic state, Indonesia has consequences that are imposed on the determining process of maritime boundaries. A coastline is where the surface of the earth's ocean meets the land topography. Consequently, maritime boundaries themselves have always been derived from the coastline. This makes the dynamics of the sea a key contributing factor in defining maritime boundaries. Therefore, it is vital that the displacement of coastlines is continuously updated to synchronize the maritime boundary with the actual condition at any given location. This research is aimed at determining coastline displacement rates in Peusangan River Confluence in Aceh Province, and the Port of Gentuma, Gorontalo Province. It will be conducted by processing multispectral remote sensing satellite imagery of the given area using the NDWI (Normalized Difference Water Index) method to distinguish between water and non-water bodies in the image. Coastline gradient and tidal range (representing horizontal and vertical components) data are then used to correct the momentary coastline captured by the satellite. This raster is then further refined by using Otsu image thresholding. The resultant raster is then analyzed using DSAS (Digital Shoreline Analysis System) software to obtain the figure of shoreline displacement rate. The expected results of this research are determining the rate of coastline displacement at a given location, and whether natural and geodynamics-related factors influence the legal and technical aspects of maritime boundaries. It is expected that in places where river deltas are prevalent, coastline displacement will occur due to naturally forming erosion and sedimentation.

Keywords: Coastline, Satellite Imagery, Maritime Baselines, Maritime Base Points, Maritime Boundaries,

Extended Urbanization of Small Cities and Spatial Structure Evolution of The Regions: A Comparison of Two Cities of Central Java, Indonesia

Fadjar Hari Mardiansjah

Universitas Diponegoro, Indonesia

Urbanization process of cities in Java has entered into a regional stage process as where the process expands urban areas from the core area in kota (cities) to the surrounding kabupaten (regencies) and results in the formation of extended urbanization. The formation also creates and develops towns surrounding the core region, and changes the spatial structure of the region from monocentric to polycentric urban region. This study aims to elaborate on the understanding of spatial structure evolution in the extended urbanization process of small cities. The influence of the urbanization process is analysed through a time series analysis on the formation and development of towns surrounding the core and the roles of the towns as part of the urban region formation. In doing so, this study uses urban villages classification, performed by Statistics Indonesia, of 1990, 2000, 2010 and 2019, to analyse the towns' development and typology. Later, the roles of the towns are analysed through the availability of urban services in the towns. The evolution of the structure is analysed through the combination of towns developed, typology and their roles within the observed timeframe. A comparison of the case of two cities, Kota Tegal and Pekalongan, is used to gain a better understanding on the issue. The findings show that management of extended urbanization process should be implemented to form a better spatial structure of the region in the future. Cooperation between kota and the surrounding kabupaten is also important to ensure integrative management of the extended urbanization process.

Online Activities and Space Efficiency: Opportunities to Build City Resilience in the 4.0 Industry Era

Iredo Bettie Puspita, Andri Kurniawan, and Muh Aris Marfai

Faculty of Geography, Universitas Gadjah Mada, Indonesia

The industry 4.0 concept has driven significant changes in human activities based on the Internet of Things (IoT). A person can do many activities at the same location and simultaneously through online activities. Efficiency is the basis for many people doing the online activity. This study explores space efficiency due to the various characteristics of online activities to build urban resilience from the physical side. The method used to achieve this goal is Artificial Neural Network with the Self Organizing Mapping model (ANN-SOM). This study uses ANN-SOM to identify space usage behavior from 400 people who do online activities in Yogyakarta and Semarang City. It also uses comparative analysis and spatial distribution analysis based on Geographic Information System (GIS) to complement ANN-SOM. In this study, reducing space requirements and increasing the variety of activities in one type of land-use are indicators to identify space efficiency. The results found that the types of activities, such as online shopping of non-producer goods, online training, and online consultations, showed a trend towards efficient use of space. This space efficiency directs the spatial intensification pattern for trade, offices, and settlements through multiple uses and multiple activities. In this condition, various human activities transfer from physical space to virtual space. In the long term, this spatial efficiency reduces the space requirements for cultivation areas and add protected area. So that, spatial planning becomes more effective, which is one indicator of city resilience.

Keywords: Online Activities, Land-Use, Space Efficiency, And City Resilience

Effect of Changes Composition and Intensity of Green Space on Surface Temperature: Case Study in Pekalongan Regency

Brian Pradana, Ade Pugara, Deny Aditya Puspasari

Vocational School, Universitas Diponegoro, Indonesia

The spatial planning document is planning guidance intended to regulate an area's spatial use and development planning. This document contains the component that regulates the composition of green space. This composition is designed to maintain the stability of the existing ecosystem quality. Pekalongan is one of the Regency in Central Java Province with environmental problems related to lack of green space area. The existence of ecological degradation makes environmental quality in Pekalongan one that needs to be considered. This study aims to determine the effect of changes in the composition and intensity of green space on surface temperature from these problems. This study will use time-series data during the initial implementation of spatial planning documents (2013) to the current year (2021) to see how changes in the composition and intensity of green space in each sub-district in Pekalongan Regency. The method used is descriptive quantitative with a GIS approach. The result of this study can be a consideration to make policies related to green space.

Keywords: Green Space, Surface Temperature, Environmental

The Influence of The Land-use Changes on The Water Carrying Capacity in Kajen

Ade Pugara

Diponegoro University, Indonesia

Kajen Sub-District is the Capital of the Pekalongan Regency. This area is the center of activity that grows to be the urban area with trading and services as the economic pole. The trading and services activity is escalating inherent with the existence of IAIN and UNDIP campus. The new campus increasing the need for a dormitory or housing and facilities area. Its result of land conversion in vegetation and agriculture. This spatial and development planning above contain in the Pekalongan Regency spatial document years 2020 – 2040. According to that document, the built-up area is predicted to 50 % growth by the end of the planning period. The decreasing area of vegetation or green space influence the water carrying capacity. That issue becomes very important because it's related to basic human needs and disaster management such as prevent floods and drought. Thus, the spatial and development planning should be evaluated related to that effect to water carrying capacity. The study regarding the influence of the land-use changes on the water carrying capacity in Kajen is conducted with the deductive–quantitative method. The deductive is begin to form theoretical synthesis about the themes and then search the empirical fact to compare. The quantitative approach means the data of the study is can be count rationally. The analysis tools of the study are spatial analysis and correlation. The study aims to examine the influence of the land-use change on the water carrying capacity and the most significant land use which influences it.

Keywords: Land-use, Water, Carrying, Capacity, Conversion

Urban Heat Island: Spatial Model Green Open Space Needs for Mitigation in Kendal Industrial Park

M Indra Hadi Wijaya, Nofa Martina Ariani, Bagus Nuari Priambudi

Diponegoro University, Indonesia

The development of industrial estates is a strategy in encouraging the growth of national industries. The development of industrial estates, especially in the regions, is an implementation of the 2015-2035 master Plan of National Industry Development. Kendal Industrial Park (KIP) is one of the industrial estates in Central Java which is experiencing growth and is expected to be one of the choices for investors. The development of industrial estates in the regions has an impact on changes and increases in space requirements. This condition makes land-use change green land into industrial land which is the cause of the effect of rising air temperatures in cities. This study intends to identify the need for green open spaces spatially based on the phenomenon of increasing temperature in the Kendal industrial area using the Urban Heat Island (UHI) approach. Remote Sensing via satellite imagery is used to detect UHI spatially. The location of this UHI will later be used as spatial modeling data to assess how big and where green open space is needed. The results of this study are in the form of a spatial model simulation of the adequacy of green open space which will mitigate the UHI phenomenon in the Kendal industrial area which is presented spatially in the form of a thematic map.

A Spatial-based Poverty Alleviation Strategy in the Impact of the Covid Pandemic in Tulungagung Regency

Bayu Seno Aji, Alfian Rosiadi

Local Development Planning Agency of Tulungagung Regency, Indonesia

As we know that the Covid Pandemic has an impact not only on the health aspect, but also on the economic aspects of the community. It is also being faced by Tulungagung Regency, where the impact of the Covid pandemic has actually had an impact on the economy of the people of Tulungagung. It can be seen from the decreasing trend in the poverty rate of Tulungagung Regency in the last 5 years which has increased again to 7.33% in 2020 from the previous 6.74% in 2019. Local government is faced with a dilemma choice, which sector will take precedence to be handled, between health and the community economy. Within the limitation of regional revenue and expenditure budgets (APBD), it is necessary to prioritize to reduce poverty levels in Tulungagung Regency, one of which is by identifying clusters of poverty using the Geographic Information System (GIS) through spatial pattern analysis. From this spatial analysis, it will be identified clusters of poverty which are priority villages in poverty alleviation efforts. Based on the results of the analysis, the results show that in Tulungagung Regency there are 4 clusters of poverty which become priority, namely first priority (high-high clusters) of 15 villages, second priority (high-low clusters) of 3 villages, third priority (low-high clusters) of 12 villages, and fourth priority (low-low clusters) of 24 villages. It is hoped that this poverty alleviation priority village can support efforts to reduce poverty in Tulungagung Regency as well as support the first goal of SDGs

Keywords: Poverty Alleviation, Spatial Analysis, Economic Development

Rural Health Services during Covid-19 Pandemic in Central Java, Indonesia: Rethinking Remoteness

Isti Andini, Achmad Djunaedi

Universitas Gadjah Mada, Indonesia

Covid19 pandemic, since 2019 in global world and 2020 in Indonesia, changed human daily life and affected the provision of public services, especially health services. As Covid19 spread through close interactions among humans, rural areas have the advantage of remoteness compared to higher-density urban areas. In the villages with relatively isolated access, the spread of Covid-19 is very low compared to the national average. This paper discusses how remoteness has become two sides of the coin during pandemic by examining at the data of health services in three rural areas in Provinsi Jawa Tengah, Indonesia. Data collected by in-depth interviews showed that although remoteness became a key factor in delaying the spread of Covid19, it also became a key factor in the deterioration of advanced health services in non-covid diseases throughout the pandemic. This finding confirmed the vulnerability of basic services in rural areas, even on Java Island as a center of growth in Indonesia. Using causal network analysis, the discussion revealed that the vulnerability stem from the territorial approach in health service provision making rural areas less resilient during pandemic. This paper concludes that while remoteness provides a barrier in retaining the spread of pandemic disease, it also worsens the medical treatment capacity in non-pandemic diseases in rural areas. Covid19 pandemic raises the need of specific arrangement public health services in remote rural areas.

The Role of Rural Creative Economy Entrepreneurs in Urban-Rural Linkage to Promoting Sustainable Regional Development

Hafzhi N. Azmi, Holi B. Wijaya, M. Indra H. Wijaya, Zukruf Novandaya, Herlina Kurniawati

Pusat Pelayanan Perencanaan Pembangunan Partisipatif Universitas Diponegoro, Indonesia

Urban-Rural linkages are one of the supports for sustainable regional development. With the potential of creative economy in the rural area owned by Temanggung Regency, the creative economy sector can be a driving force for urban-rural linkages. One of the actors that can drive the strengthening of urban-rural linkages is creative economy entrepreneurs, who have the potential to eliminate the boundaries of urban-rural linkages through good capacity in accessing various advantages that exist in the city such as knowledge and market share while optimizing the advantages of rural locations. This study aims to examine the role of rural creative economy actors in Temanggung Regency in encouraging the strengthening of existing urban-rural linkages based on the flow of people/labor, production, commodities, capital and information. The research method used in this study is descriptive qualitative with the support of data obtained through interviews and FGDs of creative economy actors in Temanggung Regency. The result of this research is that rural creative economy actors in Temanggung Regency have the potential to strengthen urban-rural linkages, especially in the aspects of capital, information, and commodities.

Keywords: Urban-Rural Linkages, Creative Economy, Entrepreneurs, Sustainable, Regional Development

The Resilience of Street Vendors in Bogor City during the COVID-19 Pandemic

Mujio, Novida Waskitaningsih

Pakuan University, Indonesia

The Covid-19 pandemic has had a major impact on the world economy, including in Indonesia. Micro, Small and Medium Enterprises (MSMEs) are the most affected economic sector in Indonesia. Based on the data from The Ministry of Cooperatives and Small Medium Enterprises in 2020, 56% of MSMEs experienced a decrease in turnover results, 22% experienced in financing, 15% experienced difficulties in commodities distribution, and the remaining 4% had difficulties in obtaining raw materials. Among other MSMEs, the street vendors are the most vulnerable and affected sectors by the Covid-19 pandemic. The economic sector of Bogor City is also supported by the street vendor's activities. Most of the street vendors in the city experienced a decrease in their income. Based on this condition, it is important to find out the resilience of street vendors during the pandemic. This paper aims to determine the criteria that affect the resilience of street vendors in Bogor City based on the experts' point of view. This paper will contribute to simplify the decision-making system in determining strategic priorities for the recovery of street vendors sectors. This paper uses qualitative descriptive method for identifying the characteristics of the street vendors and their problems, and also the eckenrdode and topsis method for developing the most influential criteria in for strategies in recovery and resilience of the street vendors based on the experts' point a view. This paper uses questionnaire and document review to complete the data.

The Potential of Small-Scale Agro-Industry as a Sustainable Livelihood Strategy in Temanggung Regency, Indonesia.

Holi B. Wijaya, Hafzhi N. Azmi, M. Indra H. Wijaya, Zukruf Novandaya, Herlina Kurniawati

Diponegoro University, Indonesia

The manufacturing industry is a sector that has provided the largest contribution to National GDP from 2014 to the present. This potential can be increased by optimizing the productivity of the manufacturing sector, both on a national and regional scale. Based on these conditions, the central government then formulated a National Industry Development Framework for policies to accelerate industrial development at the regional level, one of which has implications for Temanggung Regency as an area that will develop its industrial area. Temanggung Regency has regional economic strength which relies on the processing industry sector and the agricultural, forestry and fisheries sectors. Temanggung Regency in the development of sustainable economic activities requires regulations that ensure environmental preservation and community welfare. This research aims to identify the strengthening of local resource-based processing businesses in Temanggung Regency, especially agro industrial products. Research activities are carried out by identifying all wood-based processing industries and business actors that are mapped spatially. Followed by determining the trend of the product being developed, the production process, the technology used, as well as the market and demand for local products. The results of this study identify the role of local resource-based business actors and their relationship to the processing industry in Temanggung Regency.

The map functions in water management. Case study: Bengawan Solo River Basin

Ratri Werdingtyas, Lintang Suminar, Kusumastuti

Universitas Sebelas Maret, Indonesia

In term of geography, water is a resource which is not favoring administrative boundaries. Water has its behavior in flowing. However, we cannot confidently say that water flows following the laws of gravity. There is no guarantee that locations which are close to reservoir or water resource are not prone. water scarcity when comparing the resource to demand for it is more relative than absolute. Water management is aimed to guarantee to make every location has access to water. In other hand, map is an important tool especially for portraying conditions of an area such as river basin. Map have played important roles in water management. This study aims to bridge between the two by interpreting the use of map in water management. Bengawan Solo river basin was chosen not only its vast coverage area but also because of its complexity in water management. It across 3 provinces and 20 municipalities. Through interview to the key stakeholders involved in water management, both from national, province, municipal government and non-government parties such as ulu-ulu, private and communities, we identified that the use of map is dedicated to inform both government and non-government actors. However, it is one-way approach where it made by the responsible government with no possibilities as a tools to minimize conflicts or problems in water management. The present work can be used to inform the limitation of the currently use map for water management and to make its improvement.

The impact of settlement development on urban growth in Pekalongan Regency

Deny Aditya Puspasari, Ade Pugara, Brian Pradana

Vocational School Diponegoro University, Indonesia

The development of community activities in a city has an impact on the growth of the city. Especially in Pekalongan Regency, where the development of the Diponegoro University campus area has impact of urban growth surrounding sub-districts. The development that often occurs in Pekalongan Regency is residential areas, especially around of Diponegoro University campus. The purpose of this paper is identifying the impact of the growth of residential areas due to urban growth in Pekalongan Regency. The method used in this study uses a descriptive qualitative approach. The results of study are indicating that the existence of urban growth caused by the existence of educational activities in Pekalongan Regency has a lot of impact on the growth of the surrounding settlements.

Keywords: Settlement, City Development, Urban Growth

Factor Influencing Basecamp Location Selection of Highway Projects

Ferry Hermawan

Department of Civil Engineering, Diponegoro University, Indonesia

The highway project has a significant challenge in carrying out its work. Procurement of massive and constant materials is a significant problem. There are problems in basecamp selection: high transportation costs due to the distance to the raw material from the quarry, and on a managerial level, selection of basecamp location is the basis for construction firm management in controlling costs, time, and quality of the project. The literature review has mapped technical and non-technical factors in two decades. However, lesson learned from historical data as a basis for decision making is still limited. The mileage factor between the quarry to the basecamp and from basecamp to the project site. Apart from technical constraints, licensing and social issues were a factor in the location determination stage. This study aims to analyze the factors that influence determining the basecamp location for out-of-town road projects. The research method used is a case study, with a qualitative approach strategy using a questionnaire from experienced parties in similar projects. Analytical Hierarchy Process approach and in-depth interview with the former technical manager of highway project from a construction company were used as a decision support tool. The results showed that a priority of basecamp selection was determined based on the factor of the distance from the base camp to the project site, the distance from the basecamp to the quarry, the plan for independent material production. This study contributes to the decision-making model for selecting basecamp locations at the managerial level in a construction company.

Strategic Decisions on Management of Urban Tourism Areas Against the Pandemic in Denpasar City: Lessons From COVID-19

I Gede Wyana Lokantara

Universitas Terbuka, Indonesia

The Covid-19 pandemic has had an impact on various economic sectors in Bali, especially in the tourism sector, which caused 56.59 percent of tourist visits to decline in 2020. As the largest city in Bali Province, Denpasar City needs improvement as an urban management strategy and movement patterns residents to create a sense of security, comfort, and minimize the spread of the Covid-19 virus. This study aims to analyze the various focus of urban management in Denpasar City as a basis for decision making using a new approach, namely the integration of physical and digital space to support the active tourism industry during the Covid-19 pandemic. This study uses a mix method with two approaches, quantitative analysis that analyzes people's perceptions in the application of spatial interaction principles traveling during the Covid-19 Pandemic, and qualitative analysis which is used to re-think the management of space management as a multifunctional cluster, especially applying the concept of safe travel during a pandemic. Based on respondents' perceptions analysis, it is important to create a safe, innovative and inclusive space by involving the decisions of many people in implementing urban tourism operational management policies during the pandemic which reached a score of 85.33%. Respondents also strongly adhere to respecting social-distancing as behavioral decisions that support space management and personal behavior. The focus of urban tourism area management that needs to be implemented as the main step of Denpasar City government policy is providing attributes/symbols for restricting movement in tourist areas.

Sustainable Rural Tourism Development Based on The Land Characteristics: Case Study of Girikerto Village, Ngawi Regency, Indonesia

Nur Miladan, Istijabatul Aliyah, Bambang Pujiasmanto, Rara Sugiarti, Margana

Universitas Sebelas Maret, Indonesia

Rural tourism is one of regional development strategies. The majority of rural tourism development focuses on the natural resources' utilization for the tourism attractions. The utilization of natural resources should be based on the land characteristics in order to achieve the sustainable rural development. Girikerto is one of villages in Ngawi Regency, located in East Java Province, Indonesia, having the potencies of natural resources for the rural tourism development. Nowadays, several tourism attractions have been existed in Girikerto, such as pine forest, camping ground, waterfall, spring, cave, tea garden, and panorama of mountain. The existence of these tourism attractions certainly produces the local economic development. However, the suitability of these tourism attractions towards the land characteristics should be interrogated. This research aims to assess the suitability of land characteristics for the development of sustainable rural tourism. It used the spatial analysis, and descriptive analysis. The results of research explain the opportunities of sustainable rural tourism development in Girikerto Village. However, it should be conceptualized in order to ensure the achievement of competitive regional development.

The Needs of the Manado-Bitung Commuterline Corridor in North Sulawesi.

Farisa Maulinam Amo

Universitas Terbuka, Indonesia

The low quality and quantity of infrastructure in North Sulawesi province has become a strategic issue which then demands an increase. The central government is working with local governments to plan the development of the Manado-Bitung corridor rail network to encourage the development of a center for sustainable economic growth, such as the development of the Manado-Bitung corridor as an Integrated Economic Zone, and a Special Economic Zone (ZES). The two national strategic activities will later become an attraction and produce a generation which then requires infrastructure to accommodate these movements. This study aims to see the preferences of potential passengers towards passenger train service levels such as Train Frequency, Connectivity, Travel Time, Tariff, and Accessibility. This type of research is descriptive research, the analysis techniques used are frequency analysis, cross tabulation (crosstab), and descriptive qualitative. From the analysis, it is known that the train service attribute that becomes a preference and affects the choice of rail transportation mode by potential passengers is the frequency of departure. if the frequency of departure <15 minutes will increase the probability of using the Railway Mode by 38%. therefore, the determination of supply must really consider the number of railroad cars, headways, and distances so that an increase in the frequency of departures can be achieved.

Keywords: Potential Passenger, Commuter line, Preference

Implementation of Klassen Typology in Mapping of Superior Commodities of Food Crops in The Malolo Agropolitan Area

Irsyadi Siradjuddin

UIN Alauddin Makassar, Indonesia

The Malolo agropolitan area is a strategic food crop production center in Takalar. The implementation of klassen tipology is used to identify superior commodities with export value from food plants cultivated by farmers in the area. This study aims to determine the superior commodities of food crops using klassen typology and to map these superior commodities in the Malolo Agropolitan Area. The analytical methods used were klassen typology and Ar-GIS mapping. The results showed that the implementation of klassen typology on food commodities in the Agropolitan Malolo area resulted in maize as the only superior commodity out of 4 other food commodities. Maize is a leading commodity in 4 areas that is Massamaturu, Timbuseng, Barugaya, and Towata. Mapping results show that 4 areas are superior commodity development, 11 areas for mainstry commodity development, 37 areas for prospective commodity development, and 38 areas for slow commodity development.

Keywords: Klassen Tipology, Superior Commodity, Agropolitan Malolo

Vegetative approach as an effort to deal with climate-related disasters in Semarang Coastal Area

Santy Paulla Dewi

Department of Urban and Regional Planning, Faculty of Engineering, Diponegoro University, Indonesia

Climate change has implications for the environment and community such as the existence of climate-related disasters. The changes of weather cycle triggers flooding in coastal areas, then high-water discharge eroded the soil and caused landslides. Land conversion of upstream area causes low water absorption and high run-off which also contributes to flooding and landslides in the downstream area. Efforts to normalize rivers and urban drainage have not been able to cope with floods and landslides. Therefore, it needs an effort to minimize these disasters. The vegetative approach is an alternative for mitigating floods and landslides that are considered more comprehensive which not only conserves landscapes but also contributes to increasing green open space provision. This study aims to analyze the possibility of applying a vegetative approach to improve the physical and socio-economic community's resiliency in coastal areas from climate-related disasters. The research method used a quantitative method with data collection techniques through literature studies, field observations, and questionnaires. The data processing stages include analysis of the physical condition to determine the physical vulnerability of the area through the physical natural map overlay technique; analysis of the climate-related disasters impact on society through descriptive statistical analysis techniques; and analysis of the possibility of applying the vegetative approach by using spatial analysis techniques to determine the level of vulnerability and priority zones for vegetation development.

Keywords: Vegetative Approach, Climate-Related Disasters, Coastal Area

Rethinking Human Rights Based Development Planning: Reflections on the Development of the Two Periods of Jokowi's Administration

Nurrahman Aji Utomo Agus Suntoro

Komisi Nasional Hak Asasi Manusia/Komnas HAM, Indonesia

The two periods of Jokowi's administration, the grand design of development based on economic competitiveness was manifested by the massive development of (physical) infrastructure. Simultaneously, the right to development, which is a manifestation of the fulfilment of economic, social and cultural rights, is very dependent on the results of development. Consequently, if development fails to achieve its goals, it will be followed by violations of economic, social and cultural rights by the state. For this reason, it is necessary to review the development planning process and test it with human rights principles to see that development planning, processes, and impacts have relevance to the respect and protection of human rights. Based on these conditions, this study will position human rights-based development as a touchstone for development planning in Indonesia. The human rights approach will be derived in the scope of compatibility between national development planning and regional development, and the scope of the suitability of planning to development practices. Examination of the flow is carried out by examining the formulation process, main content, implementation mechanisms, protection and recovery. This study uses a qualitative approach, with literature for data collection, and uses thematic analysis techniques and comparative analysis. This study uses the theory of state obligations, the framework for national development policies in Indonesia, and Maastrich's guideline to measuring the potential for violations of economic, social and cultural rights.

Keywords: Human Rights Based Development, Ecosoc Rights, National Development

Spatial Configuration of Public Open Space After Pandemic Covid-19 In Srigunting Park

Bella Monica Ratu, Santy Paula Dewi

Department of Urban and Regional Planning, Faculty of Engineering, Diponegoro University, Indonesia

The COVID-19 pandemic affects all human's lives, including the spatial use. The implementation of various kinds of countermeasures against community activities to reduce the spread of the spread of covid-19 affects the space, one of which is the public open space. Public open spaces are designed as areas that can be accessed by all people which are finally prohibited from being used in some locations. Srigunting Park is one of the many public open spaces in Semarang City that have experienced physical and social restrictions. Then, this has led to changes in the spatial use of Srigunting Park in response to the Covid-19 pandemic. Therefore, this study aims to analyze the spatial configuration of public open space utilization before and after the pandemic. The method used is the quantitative method by taking a sample of 100 Srigunting Parks visitors. The analytical method used is spatial syntax analysis to measure the spatial configuration of the Srigunting Park that affects visitors both before and after the pandemic. The results of this study show that changes occur in the addition of supporting facilities, such as hand washing facilities as well as changes in the patterns of activities carried out by visitors in the Taman Srigunting area.

Keywords: Spatial Configuration, Open Public Space, Srigunting Park

Analysis of the Influence of Quality Service of Tourism Bus to Tourism Visit Intention: A Solution for Adverse Effect of Covid-19 Pandemic

Momon

Badan Penelitian dan Pengembangan Provinsi Sumatera Barat, Indonesia

The Indonesian government through the transportation ministry has allocated the fund for economic national recovery as a respon of negative effect of covid-19 pandemic that cause decreasing of tourism visit. The fund is allocated to develop tourism infrastructure. One of the programs is the planning of tourism service transportation that will service the tourism from one tourism area to others. To analyze whether this program is the right decision in increasing the number of tourist visits, it is necessary to conduct a study that measures the influence of prospective tourists' perceptions of the quality of tour bus services on the interest in tourist visits. The measurement of prospective tourists' perceptions of the quality of tour bus services is carried out by asking questions regarding the dimensions of the quality of tour bus services, namely waiting time, walking distance to the shelter, travel time, speed and costs / sacrifices to get services. Meanwhile, the interest in tourist visits is measured by asking questions related to tourist intentions, tourists' desires and tourist planning to visit tourist objects that provide tour bus services. The data analysis technique in this study is in the form of multiple regression using STATA 14. Furthermore, the sample in this study is the general public who has an interest in traveling. It is hoped that the results of this study will provide information about the reasons tourists are interested in visiting a tourist attraction related to the tourist's perceptions of the quality of tour bus services. Furthermore, these results will be utilized by tour bus service providers to provide the best quality for their consumers

Urban Heat Island: Spatial Model Green Open Space Needs for Mitigation in Kendal Industrial Park, Indonesia.

M Indra Hadi Wijaya, Nofa Martina Ariani, Bagus Nuari Priambudi

Diponegoro University, Indonesia

The development of industrial estates is a strategy in encouraging the growth of national industries in Indonesia. The development of industrial estates, especially in the regions, is an implementation of the 2015-2035 master Plan of National Industry Development. Kendal Industrial Park (KIP) is one of the industrial estates in Central Java which is experiencing growth and is expected to be one of the choices for investors. The development of industrial estates in the regions has an impact on changes and increases in space requirements. This condition makes land-use change green land into industrial land which is the cause of the effect of rising air temperatures in cities. This study intends to identify the need for green open spaces spatially based on the phenomenon of increasing temperature in the Kendal industrial area using the Urban Heat Island (UHI) approach. Remote Sensing via satellite imagery is used to detect UHI spatially. The location of this UHI will later be used as spatial modeling data to assess how big and where green open space is needed. The results of this study are in the form of a spatial model simulation of the adequacy of green open space which will mitigate the UHI phenomenon in the Kendal industrial area which is presented spatially in the form of a thematic map.

Keywords: Industry, Remote Sensing, Urban Heat Island

Occupation of Communal Space in Residential in Kaligawe Rental Flats, Semarang City

Ardiana Yuli Puspitasari

Sultan Agung Islamic University, Indonesia

The number of slum and uninhabitable settlements in urban areas is increasing, so it requires a coping strategy to reduce the rate of addition of these slum settlements. One of the ways that the government does is by providing vertical settlements in the forms of rental flats, which are called rusunawa. Rusunawa Kaligawe located in Semarang City has housing types 21 and 24. The total number of dwellings is 648 consisting of 7 twin blocks. Changes in residential housing from horizontal to vertical directly and indirectly affect the behavior of residents in adapting to the limited space available. The ideal space for a person to move is 7.2 m²/person, by living in Rusunawa Kaligawe, the space for occupants to move is only 5.25 m²/person in type 21 and 6 m²/person in type 24. With these conditions, the residents of the Rusunawa do adjustment to narrow spaces by occupancy in communal space and adaptation to privacy spaces. This research uses a qualitative deductive approach with spatial mapping analysis techniques and overlaying the communal spatial space. The result of this research are the occupation of the communal space by the occupants is grouped into 3, namely occupation in the corridor, occupation in the hallway and occupation in the ground floor space.

Keywords: Occupation, Communal Space, Rental Flats

Understanding Spatial Planning Policies in Responding to Urban Heat Island Using GIS Analysis in The Kendal Industrial Area

Nofa Martina Ariani, Muhammad Indra Hadi Wijaya, Bagus Nuari Priambudi

Diponegoro University, Indonesia

The formulation of a spatial planning strategy in an area is strongly influenced by the development of issues and problems in the region. The spatial planning policy contained in a regional regulation must be able to be aware of and handle all current and future problems. Urban Heat Island) is currently a growing issue in various regions in Indonesia which is influenced by many factors, one of which is the increase in built-up land. The issue of Urban Heat Island is important because the effects are starting to be felt, especially for public health. Areas that are very dominant in contributing to hot temperatures in urban areas are industrial areas. Kendal Regency is one of the regions in Indonesia with a fairly dominant industrial area development. Industrial areas that are identical to built-up land, air pollution and the lack of green open space are one of the triggers for an increase in temperature. In contrast to the negative effects, the development of industrial estates in Kendal Regency is one of the drivers of the regional economy so that its existence is considered important. This study aims to understand spatial planning policies in response to Urban Heat Island in the industrial area of Kendal Regency. The research method is descriptive quantitative using spatial analysis processed through GIS software. The result of the research is a review of spatial planning policies in industrial estates based on the issue of the urban heat island. It is hoped that this research can be an input in improving spatial planning policies in the industrial area of Kendal Regency, especially to suppress temperature increases.

Keywords: Urban Heat Island, Industrial Area, Spatial Planning Policies

Analysis of Village Development in Banten Province Based on the Achievement of the IDM Value

Oki Oktaviana

Regional Development Planning Agency of Banten Province, Indonesia

The Ministry of Villages, Development of Disadvantaged Regions and Transmigration periodically calculate the Developing Village Index (IDM) in all villages in Indonesia. The results of the calculation of the IDM value, apart from being used as basic data as a reference in implementing development programs and activities in the village, also become the basis for assessing the effectiveness or performance of the Village Government. This study aims to determine the performance of village development in Banten Province based on the development of IDM achievements. The research was conducted from July to August 2020. The data analyzed were IDM data for 2018, 2019, and 2020. The analysis result based on IDM data shows that in 2020 the number of villages is very underdeveloped, or underdeveloped villages in Banten province have decreased. Compared to 2019 and 2018 the number of very underdeveloped villages in Banten Province in 2020 amounted to 16 villages, decreased compared to the conditions in 2019 which reached 25 villages and 69 villages in 2018, while for the underdeveloped village category in 2020 there were 295 villages, decreasing compared to the year 2019, amounting to 364 villages and 597 in 2018. Despite the decline, seeing that there are still very underdeveloped villages and there are still many underdeveloped villages, it is necessary to increase the Performance of Village Government or Regional Officials that handle Community and Village Empowerment matters through supervision, coordination, and synchronization of the village development program.

Quantification of Land Cover Changes in Pekanbaru City Suburbs

Firmansyah

Universitas Pasundan, Indonesia

City and village areas have different morphological characteristics of land cover, likewise the area of Pekanbaru City and the surrounding regencies have unique characteristics. However, the high level of land demand driven by increased economic activity, high natural and non-natural population growth, has made the morphology of land cover in urban and rural areas unclear. Empirically, this has begun to be seen as common in urban areas that have a role in economic activity, but there is a concern with the increasing rate of economic growth, namely the increasingly fragile environmental conditions in suburban areas. This study aims to identify changes in land cover and assess the level of suitability of land use in the suburban area of Pekanbaru City. This study uses a descriptive method with two stages, (1). Identifying land cover using temporal imagery, (2). Analyzing the level of land-use suitability. The results showed four patterns of land cover change in a suburb area of Pekanbaru City, especially on shafts road that connects with the surrounding area. These changes also indicate the mismatch of land use which has an impact on the loss of productive agricultural land in the suburbs of Pekanbaru City.

Keywords: Suburbs, land cover, land suitability, Pekanbaru

Optimization of Fire Station Supply for Fire Mitigation In Samarinda City

Achmad Ghozali

Institut Teknologi Kalimantan, Indonesia

The density of settlements in Samarinda City is faced with the risk of urban fires. In 2015-2019, fires in this area increased significantly from 265 incidents to 563 incidents. On the other hand, the distribution of fire stations in Samarinda City is not evenly distributed. Mitigation efforts in disaster risk management are needed by optimizing the provision of firefighting posts. This research aims to determine the optimization strategy of providing fire stations, both spatial distribution and the performance facilities at existing fire stations. Several stages were conducted to support the research goal. Firstly, analysis of the coverage of fire service posts based on the distribution of incident hotspots. By using Network analysis in the scope of the service area, it was found that the service coverage of the existing fire brigade is 121.85 km² or 91.04% of the serviced location. Then, overlay analysis is used to estimate the need for a fire station spatially. This analysis indicates that the hotspot area has been fully serviced so that more optimization is needed at the level of service quality such as water supply, number of fleets, and new fire stations in unserved urban areas villages such as Bantuas and Pampang Villages.

Keywords: Fire Incidents, Fire Stations, Service Coverage, Optimization

Attraction Level of Natural Tourist Resorst in Pangkalan District and Tegalwaru District, Karawang Regency

Nisrina Maliha

University of Indonesia,Indonesia

Tegalwaru and Pangkalan are one of the sub-districts in Karawang Regency which have various objects of natural wealth that can be used as tourist attractions. Some of the famous natural attractions and developed as tourist destinations in Pangkalan District and Tegalwaru District are waterfalls. Other natural resources that have been developed into a tourist destination are mountains and forests. However, of all these natural tourist resorts, they do not have the same level of attraction. This study aims to determine the level of natural tourist attraction in Pangkalan District and Tegalwaru District, Karawang Regency. The variables used to see the level of attractiveness of natural tourist resorts are the number of visitors and tourist attractions with indicators of primary facilities, secondary facilities and conditional facilities. The analytical method used is descriptive method, spatial analysis, and uses Chi Square Statistical Test to determine the relationship between the level of natural tourist attraction and the number of tourists. The results of the study will show that the higher the level of attractiveness of natural attractions, the more the number of tourists visiting and the more complete the existing facilities. Meanwhile, the lower the level of attractiveness of natural tourist resort, the less interest of tourists visiting and the availability of secondary facilities and conditional facilities are incomplete and difficult to access to reach nature-based tourist destinations.

Karangsambung-Karangbolong Geopark, As an Effort to Manage Geoheritage in Kebumen Regency

Chusni Ansori

*Research Centre for Geotechnology, Indonesian Institute of Science, Jl. Sangkuriang,
Kompleks LIPI, Bandung, Jawa Barat 40135, Indonesia*

Kebumen is the most underdeveloped district in Central Java Province. The area covers the mountains in the north to the coast in the south. Kebumen has a unique geological diversity, interesting and international scientific value so that it is widely used as a natural laboratory for conservation, education, and research purposes. Minister of Energy and Mineral Resources Decree No. 2817 K/40/MEM/2006 has designated 21,150 hectares in Karangsambung as the first geological heritage in Indonesia. At the height of Karangbolong in the southern part, there is limestone. An area of 4,089 hectares has been designated through the Decree of the Minister of Energy and Mineral Resources Number: 3873 K/40/MEM/2014 as a Kars Landscape Area, which has a protected function. Geopark is a concept of sustainable development in a single area with a geoheritage for conservation, education, and sustainable economic development of local communities. A place of 543,599 km² covering 12 sub-districts and 118 villages stretching from the Karangsambung geoheritage to the Karangbolong geoheritage has been designated as the Karangsambung Karangbolong National Geopark since 2018. This geopark is planned to be upgraded to a UNESCO global geopark. This study aims to see whether the management of the two geoheritages with the geopark concept is the right choice. The research was conducted through literature studies, field research, comparative studies on geoparks in other places, and qualitative data analysis

Keywords: Geopark, Geoheritage, Karangsambung-Karangbolong, Kebumen

The Local Government Policy in Sharing Operational Cost for Basic Education in Pandemic Era

Suroso and Nurul Aeni

Local Development Planning Agency, Pati Regency, Indonesia

Adequacy of operational cost for basic education becomes the responsibility of the central and local government. It is necessary for the success of compulsory basic education. The research aims to analyze and develop a framework for the local government policy in sharing operational cost adequacy for basic education in the study area. This research used a descriptive-quantitative approach. Data collecting was conducted by observation and interviews. The analysis used a descriptive one. There are two findings in the research. Firstly, the adequacy standard of operational cost for elementary schools is IDR 869.017 per student in 2021 and the existing operational cost including BOS and sharing cost from local government is IDR 934.400. Secondly, the adequacy standard of operational cost for junior high schools is IDR 1.063.797 per student in 2021 and the existing operational cost including BOS and sharing cost from local government is IDR 1.168.800. The existing operational cost for basic education is more than the adequacy standard of operational cost so budgeting policy implementation of basic education should be controlled relevant to government regulation namely state schools of basic education not asking for any operational cost from society (students) in this pandemic era to minimize impacts on succeeding compulsory basic education.

Keywords: Basic Education, Operational Cost, Policy

Re-Assess Gentrification Process after Physical Revitalization And pandemic COVID-19

Santy Paulla Dewi

Department of Urban and Regional Planning, Faculty of Engineering, Diponegoro University, Indonesia

The revitalization of the Old City of Semarang which began in 2016 was able to revive this area as a tourist destination. The significant development of tourism activity shows that this activity is able to act as a generator of regional economic growth. This attracts many newcomers to work or to invest in this area. As a result, the land prices and building rental prices have surged significantly. Hence, gentrification becomes an unavoidable phenomenon. Displacement of local community who previously lived for years in buildings that were left vacant by their owners had to move because these buildings would be restored then rented out. However, after the COVID-19 pandemic where many restrictions on community activities caused changes in space utilization. The existence of street vendors, which is not permitted by the government, the number has actually increased. This is because work termination so they look for the easiest job to do. On the other hand, the COVID-19 pandemic caused the number of visitors to drop drastically, making business actors who depend on tourism activities start switching jobs. Revitalization and the Covid-19 pandemic are important milestones for the gentrification process. Therefore, this study aims to re-assess the gentrification process along with the socio-economic changes after the revitalization and the covid-19 pandemic. The research method used is spatial analysis which compares some aspects such as physical transformation, space use, land prices and rent prices, land ownership, and population growth before and after revitalization and after the covid-19 pandemic.

Keywords: Gentrification, Revitalization, Pandemic Covid-19

Analysis of Potential Mass Public Transport Choice Using Geographic Information System (Case Study: Commuter Line Jakarta – Bogor)

Kami Hari Basuki

Universitas Diponegoro, Indonesia

Mode choice by the traveler is carried out with several considerations. The first assumption is that pedestrians are assumed to be users of public transportation who are likely to transfer modes from one public vehicle to another. The second suspicion is that users of two-wheeled private vehicles will transfer using mass transportation modes or other modes of mass public transportation and park their bicycles at the transit point locations. The third assumption is that motorized private transport users are a non-absolute factor, that is, they are not considered absolute because it is predicted that some of them will switch to using mass transit because it is more efficient. The interesting points is, some public transportation players own private vehicles. There has been no research that can describe the condition of how much travelers can choose the mode and how big their shift is to mass public transportation. The research step was carried out by analyzing the potential for the selection of mass public transportation by considering the socio-demographic, economic and vehicle ownership characteristics with the variable distance, time and travel costs based on user preferences with a graphical descriptive approach method which will then overlay the site to obtain the results of the mode selection pattern graphic using Geographical Information System(GIS). The application of the Transit Oriented Development (TOD) concept will be more effective if there is a transit-based mass transportation mode such as Rail Based Commuter Line (KRL) as an option, besides travelers also having private vehicles.

Using Geospatial to Estimate Agricultural Wastes Carrying Capacity in Grobogan Regency, Central Java, Indonesia

Amrih Prasetyo

Balai Pengkajian Teknologi Pertanian Jawa Tengah, Indonesia

The purpose of this study was to estimate using geospatial the feed carrying capacity of agricultural wastes especially in Grobogan Regency, Central Java, Indonesia. The population of beef cattles in Grobogan Regency, Central Java, Indonesia their decollectivication in early 2020. The carrying capacity for the cattles based on the agricultural wastes produced yearly in Grobogan Regency. The result showed that dry matter agricultural wastes 405528.81 (tons/years), The capacity of beef cattles were 924606 (animal units) and the ability to add beef cattles were 791036 (animal units). The carrying capacity indexes were at safe levels.

Keywords: Carrying capacity, agricultural waste, beef cattle, geospatial

Livability Assessment of Recreational Public Space: A Case Study of Titiwangsa Lake Gardens, Kuala Lumpur

Tengku Ihsan Fakhru Iman

Department of Urban and Regional Planning, Faculty of Built Environment, University of Malaya, Malaysia

Livability and recreational spaces are considered important aspects of urban life. However, there appears to be a knowledge gap in the current field of study of livability; which is the absence of an assessment criteria that can be used to assess / evaluate livability specifically for recreational public spaces. this research project aims to address this knowledge gap by attempting to determine the livability level of a recreational public space in kuala lumpur with titiawangsa lake gardens as the selected case study. this determination is done through formulating a custom livability assessment criterion for recreational spaces, gauging visitor's satisfaction through an online questionnaire survey and the researcher's observation and analysis from site visits. upon completion, the research has successfully created an assessment criterion for livability of recreational space and has also identified 'comfort' and 'visual aesthetics' as two of the most important aspects of recreational space design for livability. the research has also determined that titiawangsa lake gardens can in fact be considered as a livable recreational public space because the assessment revealed that the majority of qualities exhibited by titiawangsa lake gardens is contributing positively to its livability. the livability assessment criteria for recreational public space created through this research serves to help fill in the knowledge gap in the field of livability and can be used as a guide or reference for the planning, management and design of recreational public spaces in the future.

Keywords: Livability, public space, urban design, recreational, urban livability, Kuala Lumpur

The Readiness of Local Regulations in Support in Low Carbon Development in Central Java Indonesia

Alfina Handayani, Rachman Djamal, Tri Risandewi, Rukuh Setiadi

BAPPEDA PROVINSI JATENG, Indonesia

Low Carbon Development (LCD) encourages economic growth to continue to grow and develop in a region, but, at the same time, this growth needs to be achieved in ways that produce low carbon emissions. This study of regional regulation readiness aims to determine the readiness of the Central Java Provincial Government facing the implementation of the LCD. Specifically, the relevance of various planning programs and strategies contained in the 2018-2023 Central Java RPJMD in supporting the LCD. The approach used in this research is descriptive qualitative. The Central Java RPJMD document 2018-2023 is the main object of this research. Administratively, four administrative regions (Semarang City, Pekalongan City, Sukoharjo Regency, and Cilacap Regency) are empirical observation areas. A series of focused discussion activities (FGDs) were carried out in the four regions to explore various information on programs related to the LCD, its implementation, and the obstacles or obstacles to its implementation. The results indicate that local governments already have readiness for regulations related to LCD, but local governments still often encounter problems, especially in implementing regulations, caused by a lack of the local government's understanding of mitigation efforts, climate change responses, and LCD. Meanwhile, strategic policies and programs as outlined in the 2018-2023 Central Java Province RPJMD cannot be used as a reference in directing strategic and sectoral programs to become more LCD-oriented. However, these programs have the opportunity to be synergized directly with LCD-related sectors such as energy, transportation, waste, construction, and forestry, which are further detailed in the final report of this study

Keywords: Low Carbon Development, Central Java, RPJMD, Regulation Readiness

Analysis of Land Potential for Development of Natural Gas Distribution Pipeline Infrastructure for Households in Bekasi Regency

Lisna Rosmayati

PPPTMGB LEMIGAS KESDM, Indonesia

Land that can be built for a natural gas distribution pipeline network for households in an area must be close to natural gas sources and close to existing natural gas pipeline infrastructure segments, have a relatively flat land topography, dense population and there is a potential market for natural gas network users. Determination of the location and land for the construction of a natural gas network in an area depends on the potential number of households to which the household gas connection will be installed. Land mapping is carried out using a geographic information system that contains spatial data on the land surface before determining the length of the main pipe and determining the diameter of the pipe. The results of geospatial data processing, are used to identify potential locations as tap-in points from installed pipes, Metering Reduction Stations (MRS), Parent Sector Regulators (RSI), and Sector Regulators (RS), identifying locations that have the potential to become crossing in the pipeline design and checking the pipeline design with field conditions.

Study on the Links of the Spread of Covid-19 with the Establishment of Transjakarta Bus Stops on Corridor 01 (Blok M-Kota)

Fathiyyah Nur Andina, Anita Ratnasari Rakhmatulloh, Diah Intan Kusuma Dewi

Diponegoro University, Indonesia

This study was to analyze the relationship between the spread of Covid-19 and the existence of the Transjakarta bus stop on corridor 01 (Blok M - Kota). Data collected by survey method and official online sites with processed results of valid data. The method used is quantitative with descriptive analysis, buffering process, correlation analysis. Based on the results, it was found correlation value of 0.74 which means that there is a very strong relationship between the number of passengers and the number of passengers positive for Covid-19, the relationship is very strong 0.72 between the bus stop concentration values seen from the number of residents and a strong relationship of 0.67 between total tap in and tap out with positive Covid-19. Relationship is supported by surrounding land use bus stop corridor 01 but not directly to the spread of Covid-19. And there are positive correlation between the variables of population, female population, elderly population, population not schools and workers to the number of positive Covid-19.

Keywords: Bus Stop, Service Coverage Area, Covid-19

Assessing the Urban Development Impacts in the Padang Coastline City, West Sumatra Province; Coastline Changes, Abrasion, and Coastal Vulnerability

Ulung Jantama Wisna

Research Institute for Coastal Resources and Vulnerability, Ministry of Marine Affairs and Fisheries, Indonesia

The capital coastline city of Padang is intensively developed to enhance the tourism attractions and protect the coastline from natural hazards and disasters. Rapid urban developments applied in the coastal area are not gone well. Several regions have been eroded and unstable. This study aimed to reveal the significant alteration in Padang city's coastline since it was developed. Spatial analyses have been employed to determine the coastline changes and abrasion, such as a Smartline and DSAS (Digital Shoreline Analysis System) and CVI (coastal vulnerability index) approach. A hydrodynamic model was also used to illustrate the transport mechanism and predict the level of abrasion. Since rapid urban development has applied in Padang City, the substantial coastal changes and vulnerability have been reported. Interestingly, according to 146 points of coastline calculation, 66 % eroded with the rate of -0.21 - -49.4 m/year, 1 % stable, and the rest 34% are experiencing accretion. In contrast, more than 9 % of coastal areas were categorized as highly vulnerable. The erratic hydrodynamics and ineffective coastal buildings are believed to play a significant role in triggering coastal abrasion.

Impact of Land Use and Transport Interaction on Transmission of Covid-19 in Jakarta

Fathiyyah Nur Andina, Anita Ratnasari Rakhmatulloh, Diah Intan Kusumo Dewi

Diponegoro University, Indonesia

That land use and transport are known to have interaction and influence each other. Pandemic Covid-19 happened with fast transmission through physical interactions of human, so it is spread easily in public transportation. The purpose of this study to analyze about what is impact of land use and interactions in public transportation on the virus Covid-19 dissemination. The study used descriptive quantitative and mapping method. Based on the results, it was found that the type of land use shows the intensity of activity has a positive chance of spreading Covid-19, because at the bus stop with the surrounding land use commercial shopping mall and office space having a high activity intensity, which have direct impact to the spread of Covid-19.

Keywords: Land use, Bus Stop, Covid-19

UAV (Unmanned Aerial Vehicle) for Landslide Analysis Case Study in Grenggeng Village, Kebumen District, Central Java

Mohammad Al 'Afif

Indonesian Institute of Sciences, Indonesia

Remote sensing technology has developed rapidly; one of them is data acquisition techniques using UAV (Unmanned Aerial Vehicle). With high-resolution aerial photographs, an unmanned aerial vehicle (UAV) can be a flexible, cost-effective, and accurate monitoring of landslide technique. This research aimed to determine and test the utilization of unmanned aerial vehicles (UAVs) in congested areas. Data was collected at Grenggeng Village, Kebumen Regency, using unmanned aerial vehicles cruising altitude of 90 – 110 meters above ground level and a spatial resolution of 5 – 10 cm over a 0.200 km² area. In November 2020, the research site will be a landslide area with similar rock lithology to the Halang Formation's sandstone and claystone layers. Direct field observations revealed the geological structures involved and the rock lithology that produced the slip field, seepage, and the sorts of vegetation that the community had planted. According to aerial photography data, the relief appears to be a straight-line pattern in the direction of the geological structure, the slope of the layers, and different vegetation. Aerial photography using UAV can also be used to carry out rehabilitation and reconstruction techniques.

Utilization WebGIS with Story Maps Features for the Promotion of Kandri Tourism Village

Abhi Kurniawan, Ahady Farrel Febrianto, Rina Kurniati

Diponegoro University, Indonesia

Kandri Tourism Village is one of the tourist villages in Semarang City based on natural attractions and cultural arts. The many potentials in Kandri Tourism Village must be balanced with good tourism promotion. The 2020 pandemic has reduced tourist visits; therefore, tourism promotion is needed to make it exist again. One of the more attractive tourism promotion efforts is to use WebGIS technology. The purpose of this research was to assess the use of WebGIS technology in the promotion of Kandri Tourism Village. The method used is to collect spatial data and visualize it using the Story Maps feature in ArcGIS Online by telling a location supported by maps, photos, videos, and other supporting data. The results of this study indicate that WebGIS technology can be used to promote Kandri Tourism Village by collecting spatial data and compiling tourism information into digital form which produces a website display with interactive maps that are easily accessible. The conclusion of this research is the use of WebGIS as an alternative for tourism promotion. The benefits of this research can attract tourists to visit Kandri Tourism Village and provide input for relevant agencies in the recovery of the tourism sector in the future.

Keywords: Story Maps, WebGIS, Tourism Village Promotion.

The spatial relationship of urban geometry to the incidence of COVID-19 disease: Urban Form Study in the City of Yogyakarta

Nugroho Purwono

Gadjah Mada University, Indonesia

This paper tries to explore spatial relationships of urban form to the distribution of COVID-19 through a spatial perspective. In this pandemic context, cities are complex systems whose characteristics affect to peoples' health who live in them. Complexity of urban system has been represented by urban form, which shows the evolution of physical characteristics as a result of human interactions inhabit every urban space. The physical aspects of the city have been seen from urban geometry, especially the typology of building density on every spatial scale. Taking into account ongoing phenomenon of COVID-19 outbreak, it is important to find out to what extent the spatial relationship between urban geometry and COVID-19 prevalence is. The significance of the relationship between them was assessed from the description of spatial analysis by using Geographically Weighted Regression method. The results indicate that urban space on a sub-district scale has an association of spatial relationships with the distribution of COVID-19 prevalence. Regarding to the city of Yogyakarta, it shows that sub-districts with higher building density index are associated with the prevalence of COVID-19 recently. Furthermore, this spatial relationship in each area follows the degree of building density, which associated with the number of populations and intensity of human activity in that urban area.

Watershed Management Approach: Alternative Solutions for Flood Management in Northern Part of Central Java

Endang Savitri, Rahardyan Nugroho Adi, Pamungkas Buana Putra, Yonky Indrajaya

Watershed Management Technology Center, Indonesia

The flood disaster in northern Central Java was caused by rainfall, the influence of tidal surges and ground subsidence in various sites. This study aims to give alternative solutions to flood control in Central Java watersheds emptying the north coast. By identifying areas supplying floodwater, we can reduce the amount of runoff causing flooding. By overlaying maps of flood supply, land cover, land criticality, and area functions, 12 forests and land rehabilitation (RHL) recommendations are obtained, suited to the area's concerns. The RHL recommendation is only planned for areas with vulnerable and highly vulnerable flood supplies, so priority is given to activities that incorporate runoff into the ground as much as possible to reduce the flood volume. The RHL is grouped into the enrichment of plants in open areas with the function of forest areas, enhancing terraces to reduce erosion, increasing soil fertility, and constructing infiltration wells or bio pores. Of the 31 regencies/cities whose rivers flow into the north coast, there are 5 (five) regencies/cities whose RHL recommendations are applied to more than 50% of the area, namely Salatiga City (71%), Jepara Regency (63%), Kudus Regency (56%), Pemalang district (55%), Semarang district/city (54%). If the RHL recommendations are seen based on watersheds that empty into the Java Sea, almost all major watersheds in Java are vulnerable and very vulnerable to flood supplies. It is recommended to implement the 12 recommendations. The watersheds are the Tuntang, Juwana, Serang, Comal, Sragi, Blorong, Bodri, and Jragung watersheds.

Keywords: Flood vulnerability, land rehabilitation activities, flood disaster

Urban Public Space in the Pandemic Era

Edy Darmawan

Diponegoro University, Indonesia

In this era of the Covid-19 pandemic, public spaces have become alternative tourist attractions for people to release boredom after staying at home for days. However, on the one hand, public space is also a shared space that can be used by anyone, while in this pandemic era people are required to implement health protocols by maintaining social distance to reduce the rate of spread of Covid-19. Based on this, the purpose of this study is to describe the condition of public spaces in the pandemic era. The research method used is literature study through in-depth analysis in parsing the problem according to the research theme and conducting a direct survey to the object of observation. The results of the study can show patterns of community activity and public spatial planning during the pandemic era which can be used as a study in managing safe public spaces in this pandemic era.

Keywords: Urban Public Space, Pandemic Era, Covid-19

Analysis of Nature-based Disaster Patterns: A Worldview from a 120-year data set

Fahrul Hidayat

Master of Urban and Regional Planning, Bandung Institute of Technology, Indonesia

The essence of urban and territorial planning is how to place living thing (especially human) activities in certain space and time by considering the balance of the ecosystem. Disasters will not occur if human activities are not located in hazard-prone areas (natural, technological, biological, etc.). For almost 2 years, the Covid-19 pandemic is an example of a biological hazard that forces scientists to develop statistical methods for public health problems. Data is one of the new sources of wealth because it is very valuable for the sustainability of the ecosystem. The global disaster database, such as EM-DAT, is an example that needs to be optimized by urban and territorial planners. However, the lack of publications in Indonesia that utilizes the global disaster database needs to be noted. This research was conducted to provide a big picture of nature-based disasters, worldwide in the 1900 – 2020. One of the questions to be answered through this research is related to the characteristics of disasters which include patterns of natural hazard events, affected people, deaths, and damage. How the relationship between disaster variables, and how their spatial distribution around the world, needs to be answered using statistical and GIS methods. The results showed that the increase in the number of disaster events significantly and simultaneously affected the number of affected people, deaths, and damage. In addition, Indonesia is included in cluster 1 along with other countries such as the United States, China, and Japan which have experienced repeated disasters events.

The Impact of the Corona Virus 19 Pandemic on the Studentification Area in the Higher Education District in Semarang

Retno Susanti and Silvia Tria Septiani

Diponegoro University, Indonesia

According to the Semarang city spatial plan, private universities in Semarang City allocated in the Bendan area. As a result, several universities built in the Bendan area (covering Karangrejo village, Bendan Dhuwur village and Bendan Ngisor village). The existence of this higher education district encourages the studentification process due to the high concentration of students in this area. Since the Corona Virus 19 pandemic outbreak in Indonesia in March 2020, the lecture has gradually shifted to online lectures. Students return to their respective areas of origin to reduce the impact of the spread of the virus. The decrease in the number of students in large numbers means that the demand for student needs will also decrease. Areas that previously underwent a studentification process have lost their role. The physical, economic, social and environmental aspects that have changed due to the studentification process are currently changing due to the minimal number of students served. This study identifies changes in the studentification area in the Bendan district during 2020-2021 due to the minimal number of students. The first stage is to develop a map of the distribution of the physical and economic change process based on field observations. The next stage is confirmation of physical, economic, social and environmental changes to the informants based on the results of interviews. Finally, the results of this study show the chronology of the changes that have occurred and conclude the stages of de-studentification caused by the Corona Virus pandemic 19.

Keywords: Corona Virus 19 Pandemic, Studentification

Correlation Individual Capabilities in Urban-Rural Linkage

Dwi Fitrianiingsih

Gadjah Mada University, Indonesia

Urban and rural areas are two areas that have different characteristics but are interrelated with each other. Urban-rural linkage can be broadly defined as the reciprocal flow of people, goods, money, resources and services in general. Urban-rural linkage is also related to the capability of the community which is assessed based on the availability and function of assets. This study aims to provide an overview of the correlation of individual capabilities in urban-rural linkage system. Based on the results of the calculation of the Community Capability Index (CCI), it is known that high CCI values is around urban and rural areas that are directly adjacent to urban areas. The results of the correlation analysis show that the urban-rural linkage can be influenced by the magnitude of the individual's capability, if individual's capability is high, the greater the frequency of the individual traveling from the village to the city or vice versa. The high or low frequency of people traveling is influenced by the reasons people travel, this is related to the availability and function of assets that form individual capabilities.

Cooperation between Lambanapu and Kanatang weaving crafter in East Sumba

Rustina Untari

Soegijapranata Catholic University, Indonesia

Sumba weaving has existed since time immemorial. Weaving is used for traditional purposes, including funerals, clothing when attending traditional meetings, to gifts (wedding dowries). Therefore, weaving activities are part of the life of the Sumba people in general. In its development, starting in the 70s or 80s, Sumbanese weaving began to be requested by people outside Sumba. Since that time, weaving activities have not been merely a household activity, but have been generally managed as a business. Moreover, in East Sumba, groups of craftsmen have emerged with their own characteristics, even small industrial cluster embryos have emerged. This paper will discuss the cooperation between groups of weavers in Lambanapu village, Kampera sub-district and Kanatang village, Kanatang sub-district. The research was conducted by observing the craftsmen in the two locations and conducting interviews. The interview continued, even though the researcher had returned to campus. The main finding is that the craftsmen from Lambanapu want the best results, especially in blue. The analysis also found that between groups of craftsmen specialization emerged as befits a cluster.

Keywords: Weaving, Sumba, Cluster, Cooperation

Semarang City Resilience Based on the Perspective of Social-Economic-Ecological Resilience

Mohammad Muktiali

Diponegoro University, Indonesia

The existence of Semarang City as a tough and sustainable city is still considered less convincing. This is indicated that there are still many urban issues and problems such as floods, tidal waves and natural disasters such as landslides that still hit the city of Semarang and have a negative impact on the socio-economic aspects of the community. This study examines the city of Semarang as a resilient and sustainable city based on the perspective of Social-Economic-Ecological Systems (SER). This study uses qualitative research because it is in accordance with the characteristics of this study, namely examining in detail the aspects of Social-Ecological Resilience (SER). The key factors needed in the development of Semarang City as a resilient and sustainable city are a systemic and comprehensive perspective through a transdisciplinary approach to the socio-economic-ecological problems of Semarang City, strong political will, good governance and full commitment of stakeholders.

Keywords: Social-Economic-Ecological Resilience (SER), urban resilience, urban development.

Economic Recovery Strategy Due to The Impact of The Covid-19 Pandemic on The Conditions of Micro Small Medium Enterprises (MSME's) in Central Java Province, Indonesia

Wiwin Widiastuti, Alfina Handayani, Agus Hermawan

Bappeda Prov. Jateng, BPTP Jawa Tengah, Indonesia

MSMEs are the backbone of the economy in Indonesia. However, most of MSMEs were collapse due to Covid-19 pandemic. Therefore, MSMEs recovery is needed to restore the real sector, particularly in Central Java. The study analyses the impact and economic recovery strategies during and after Covid-19 in the MSME sector. The research used a descriptive qualitative method. Data were collected by electronic survey and in-depth interviews and analyzed by SWOT. The results showed the Covid-19 pandemic significantly reduced MSME business actors' profits due to decreased sales, while production costs remained or even increased. MSME entrepreneurs took several strategies to keep their business running. The methods include looking for new markets, providing discounts and bonuses, diversifying products, giving a consignment, looking for cheaper suppliers/raw materials, and purchasing raw materials with the last payment due. Potential risks when MSMEs are unable to maintain business are (1) lousy credit; (2) layoffs for workers and bankruptcy for business owners; and (3) supply and demand drop. The government should take action to recover MSMEs. The promising policies are (1) Facilitate MSMEs with capital for purchasing raw materials, (2) Development local supply chains through trading houses and regional logistics, (3) Massive promotion of MSME's products at commercial and tourist centers, (4) Optimization of local resources through science and technology implementation and triple helix cooperation.

Keywords: covid-19 pandemic, economic recovery, MSME's

Urban level of Service: Street Crowdedness and Congestion Level Using Wi-Fi and GPS Data in Small Bus

A Hidayat, S Terabe and H Yaginuma

¹*Urban and Transportation Planning Laboratory, Department of Civil Engineering,
Tokyo University of Science, 2641 Yamazaki, Noda 278-8510, Japan*

²*Department of Civil Engineering, Universitas Teknologi Sulawesi, Jalan Talasalapang No. 51 Makassar 90221,
Indonesia*

Currently, Wi-Fi is one of the emerging technologies. Wi-Fi is related to media access control (MAC) address data. MAC address is representing to number of devices which means representing the number of people. MAC address data can be used to determine the crowdedness the road or land use by using Wi-Fi scanner equipment to detect the number of devices and GPS for analysing the vehicle speed. This study aims to determine the urban level service from transportation service or crowdedness and congestion level of the road by using Wi-Fi data (MAC address). The method was used for this study by obtaining a Wi-Fi scanner and GPS scanner inside the bus. The Wi-Fi scanner to collect MAC address data and GPS to calculate the speed of the bus. The hypothesis for the crowdedness in this research is the speed of the bus which is low, and total of MAC addresses is high at a time and conversely. The result shows the highest correlation value between speed and total of MAC address is -0.629. Based on the minus value correlation, the bus speed becomes slow, and the total of MAC address becomes higher and otherwise. The value shows the crowdedness zone around the bus route at a bus service time. For congestion level, some parameters were analyzed such as travel time, travel speed, and standard deviation/variance. Analyzing these aspects, the street condition that link in good service or bad service. The congestion levels can be determined based on RI, which are from the standard deviation and average of the speed of each link of the road.

Suitability Evaluation of Space Utilization Activities in The Tin Mining Area, Case Study: Sungailiat District, Bangka Regency

Roma Anggiadini, Suprajaka

¹ *Department of Urban and Regional Planning, Esa Unggul University, Indonesia*

² *Geospatial Information Agency and Lecturer in the Department of Urban and Regional Planning, Esa Unggul University, Indonesia*

The government has perfected the spatial planning process with the issuance of Law Number 11 of 2020 concerning The Job Creation Act and Government Regulation Number 21 of 2021 concerning the Implementation of Spatial Planning. This is a strategic step in overcoming the problems of investment and job creation, one of which is caused by overlapping spatial plan. In principle, spatial planning is intended, among others, to: create harmony between the natural environment and the artificial environment, create integration in the use of natural and man-made resources with human resources, and realize spatial function protection and prevention of negative impacts on the environment due to spatial use. However, in reality, the problem of mismatching of spatial use against spatial planning and overlapping permits is currently still increasing, both in terms of the number of incidents, their area, and their intensity. This is because, space is increasingly limited, the human population continues to growth, the demands of human activities and activities are increasing, while space is also not only for humans but animals and plants also need it. In addition, the process of using space must also consider disaster issues, so that its availability is increasingly becoming more limited in terms of the suitability of space to support human activities. Therefore, based on these problems, this study is intended to evaluate the suitability of space utilization activities (KKPR), especially in the tin mining sector. The research method used in this research is to compare the spatial pattern plan that has been determined with the implementation of the tin mining area permit in Sungailiat District as a case study. Based on Regional Regulation Number 15 of 2014 concerning Detailed Spatial Plans and Zoning Regulations for the Sungailiat Urban Area of 2014-2034 it is used as a basis for identifying, analyzing and evaluating spatial use permits in the tin mining business.

Keywords: Spatial analysis, suitability of space utilization, tin mining licensing

Re-Assessing Gentrification Process Post- Pandemic COVID-19 in the Old Town Semarang

Santy Paulla Dewi, Retno Susanti, Grandy Loranessa Wungo

Urban and Regional Planning Department, Diponegoro University, Semarang, Indonesia

The revitalization of the Semarang Old Town revived this area as a tourist destination and generated regional economic growth. Several new restaurants, coffee shops, galleries, and other economic activities emerge along with tourism development. Job vacancies were offered and attracted newcomers to work as well as to invest. Consequently, properties that previously had no economic value became a potential asset, increasing land prices and building rental prices significantly. Hence, gentrification becomes an inevitable phenomenon. Local communities previously inhabited vacant buildings for years were displaced because the buildings would be restored and then rented out. However, these situations changed after the COVID-19 pandemic occurred, that many restrictions on community activities, including tourism. Visitors' numbers decrease drastically, making many businesses in the Old Town suffer losses. It pointed by several coffee shops and restaurants closed, or they did not extend the rents. In contrast, the number of informal sectors which restricted surged in line with many work terminations. Hence, this study aims to re-assess the gentrification process along with the socio-economic changes after the COVID-19 pandemic. This study used a quantitative method by applying the spatial analysis method, which compares aspects such as physical transformation, space use, land prices, rent prices, land ownership, and population growth before and after the COVID-19 pandemic.

Keywords: Gentrification, COVID-19, Old Town Semarang

The use of data and information in irrigation water management. Case study: Colo irrigation area, Bengawan Solo River Basin

Ratri Werdiningtyas, Lintang Suminar, Kusumastuti

Urban and Regional Planning Program, Faculty of Engineering, Universitas Sebelas Maret, Surakarta, Indonesia

In term of geography, water is a resource which is not favouring administrative boundaries. Water has its behaviour in flowing. However, we cannot confidently say that water flows following the laws of gravity. There is no guarantee that locations which are close to reservoir or water resource are not prone. Water scarcity when comparing the resource to demand for it is more relative than absolute. Irrigation water management is aimed to guarantee to make every agricultural land has access to water. In other hand, map is an important tool especially for portraying conditions of an area such as river basin. Map have played important roles in water management. This study aims to explore the use of data in decision making in irrigation water management practices. Colo irrigation area in Bengawan Solo river basin was chosen not only its vast coverage area but also because of its complexity in water management. It across two provinces and six municipalities. Content analysis was undertook to analyse two data sets: laws and regulation related to water management practice and the interview of policy actors. Elaborating the implementation of laws and regulations regarding to the use of data and information in irrigation water management, the comparison of the results also disclosed deviations among what it is regulated and what it is implemented. Quantitative and qualitative data that mostly used in practices cannot fully support to inform water conditions, physical and environmental conditions, social economic conditions in wider context. Spatial data is essential tools to represent comprehensive interconnected data and information in wider context. A profound understanding of stakeholder perspectives on the role of each data and information is essential for policy actors in the implementation of integration water resource management. Shared, comprehensive and interconnected data can promote common ground and collaboration potential.

The Influence of The Land-Use Changes on The Water Carrying Capacity in Kajen

Ade Pugara, Brian Pradana, and Deny Aditya Puspasari

Diponegoro University, Indonesia

Kajen Sub-District is the Capital of the Pekalongan Regency. This area is the center of activity that grows to be the urban area with trading and services as the economic pole. The trading and services activity is escalating inherent with the existence of IAIN and UNDIP campuses. The new campus increasing the need for a dormitory or housing and facilities area. Its result of land conversion in vegetation and agriculture. This spatial and development planning above contain in the Pekalongan Regency spatial document years 2020 – 2040. According to that document, the built-up area is predicted to be 50 % growth by the end of the planning period.

The study regarding the influence of the land-use changes on the water carrying capacity in Kajen is conducted with the deductive–quantitative method. The deductive is begin to form theoretical synthesis about the themes and then search the empirical fact to compare. The quantitative approach means the data of the study is can be count rationally. The analysis tools of the study are spatial analysis and correlation. The study aims to examine the influence of the land-use change on the water carrying capacity and the most significant land use which influences it. The result of the study it the most influencing land use in water carrying capacity is a settlement with an 8,7 point level of correlation. The settlement appears from the agricultural land conversion, especially dry land and paddy field.
