INTRODUCTION TO LINGUISTICS

UNDERSTANDING THE BASIC THEORY

UU No. 28 Tahun 2014 tentang Hak Cipta
Ketentuan Pidana
Pasal 113

- (1) Setiap orang yang dengan tanpa hak melakukan pelanggaran hak ekonomi sebagaimana dimaksud dalam Pasal 9 ayat (1) huruf i untuk Penggunaan Secara Komersial dipidana dengan pidana penjara paling lama 1 (satu) tahun dan/atau pidana denda paling banyak Rp 100.000.000,00 (seratus juta rupiah).
- (2) Setiap orang yang dengan tanpa hak dan/atau tanpa izin Pencipta atau pemegang Hak Cipta melakukan pelanggaran hak ekonomi Pencipta sebagaimana dimaksud dalam Pasal 9 ayat (1) huruf c, huruf d, huruf f, dan/atau huruf g untuk Penggunaan Secara Komersial dipidana dengan pidana penjara paling lama 3 (tiga) tahun dan/atau pidana denda paling banyak Rp 500.000.000,00 (lima ratus juta rupiah).
- (3) Setiap orang yang dengan tanpa hak dan/atau tanpa izin Pencipta atau pemegang Hak Cipta melakukan pelanggaran hak ekonomi Pencipta sebagaimana dimaksud dalam Pasal 9 ayat (1) huruf a, huruf b, huruf e, dan/atau huruf g untuk Penggunaan Secara Komersial dipidana dengan pidana penjara paling lama 4 (empat) tahun dan/atau pidana denda paling banyak Rp 1.000.000.000,00 (satu miliar rupiah).
- (4) Setiap orang yang memenuhi unsur sebagaimana dimaksud pada ayat (3) yang dilakukan dalam bentuk pembajakan, dipidana dengan pidana penjara paling lama 10 (sepuluh) tahun dan/atau pidana denda paling banyak Rp 4.000.000.000,00 (empat miliar rupiah).

This book is dedicated to all my students.
Your willingness to study English hard with your inadequacies
has been an inspiration and taught me how to be a better teacher.
I am indebted to each of you.

Contents

Preface — vii
acknowledgements — x

Chapter one

Communication in Humans' social life — 1

1. The Word 'Communication' Defined — 1
2. Human communication systems — 5
 - 2.1. speech communication system — 5
 - 2.2. writing communication system — 14
 - 2.3. gesture communication system — 17

Chapter two

Language and Linguistics — 25

1. The Word 'Language' Defined — 25
2. the origin of language — 31
 - 2.1. the theory of divine origin — 31
 - 2.2. the theory of evolutionary development — 33
 - 2.3. the theory of language as a Human Invention — 34
3. language and linguistics — 35

Chapter three

Understanding Phonetics — 39

1. The Word 'Phonetics' Defined — 39
2. the Production of segmental sounds — 44

- 2.1. English consonant sounds — 44
 - 2.1.1. Place of articulation — 44
 - 2.1.2. manner of articulation — 46
 - 2.1.3. the distinctive features of the English consonant sounds — 48
- 2.2. The Production of Vowel sounds — 49
 - 2.2.1. Vowel sounds in English — 52
- 3. The Production of supra-segmental sounds — 54
 - 3.1. word stress — 54
 - 3.2. Intonation — 56
 - 3.3. Juncture — 57

c HaPter foUr

UnderstandI ng PHonologY — 59

- 1. The Word ‘Phonology’ Defined — 59
- 2. sounds Patterns: c ontrastive and non- c ontrastive sounds — 63
 - 2.1. c ontrastive sounds: minimal Pairs — 64
 - 2.2. non-contrastive sounds: allophone — 67
- 3. Phonological r ules — 69
 - 3.1 assimilation — 70
 - 3.2 dissimilation — 70
 - 3.3 Insertion — 71
 - 3.4 deletion — 72
 - 3.5 metathesis — 73
 - 3.6 fortition (strengthening) — 74
 - 3.7 l enition (weakening) — 75

c HaPter fIVE

UnderstandI ng mor PHologY — 77

- 1. The Word ‘Morphology’ Defined — 77
- 2. Understanding word, l exeme and word-form — 80
- 3. word structures: morphemes — 81
 - 3.1 t ypes of morpheme — 82
 - 3.2 Affixes — 83

4. Word Pattern: Inflections — 86
 - 4.1 Inflection of nouns — 87
 - 4.1.1 Pluralization — 87
 - 4.1.2 Possessive case of nouns — 92
 - 4.2 Inflection of adjectives — 96
 - 4.3 Inflection of verbs — 100
 - 4.3.1 Tense: inflection of verbs — 100
 - 4.3.2 Aspect: inflection of verbs — 104
 - 4.3.3 Passive Voice: inflection of verbs — 110
5. word formations: Productive and less productive word formation — 112
 - 5.1 Productive word formation — 112
 - 5.1.1 c ompounding — 112
 - 5.1.2 derivation — 120
 - 5.2 l ess productive word formations — 132
 - 5.2.1 c oinage — 132
 - 5.2.2 Borrowing — 134
 - 5.2.3 Blending — 134
 - 5.2.4 c lipping, — 135
 - 5.2.5 Backformation — 136
 - 5.2.6 c onversion — 137
 - 5.2.7 acronyms — 139

c HaPter sIX

UnderstandI ng sYntaX — 141

1. The word ‘Syntax’ defined — 141
2. t he c oncept of sentence in approaches to syntax — 143
 - 2.1. t he t raditional approach to syntax — 144
 - 2.2. t he structuralist approach to syntax — 145
 - 2.3. t he t ransformative-generative approach to syntax — 147
3. t he structure of sentences — 149
 - 3.1. noun Phrase (nP) — 150
 - 3.2. auxiliary (aux) — 151
 - 3.3. Verb Phrase (VP) — 150
 - 3.4. Prepositional Phrase (PP) — 151
 - 3.5. Conjoined Phrase (CP) and Conjoined Sentences (CS) — 151

Chapter 10

Understanding Semantics — 157

1. The word 'Semantics' defined — 157
2. meaning in words, phrases, and sentences — 159
 - 2.1. Lexical semantics — 159
 - 2.2. Sentential semantics — 166
3. Interpretation of words, Phrases and sentences — 169
 - 3.1. Ambiguity — 169
 - 3.2. speech act — 172

References — 175

Additional Exercises — 183

Preface

بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

At this time, many people think that linguistics is a discipline which is simply focused on describing two things i.e. *The first*, the phenomena of human language such as the similarities and differences of the languages of the world. *The second*, the properties of human language such as sound, words, phrases, sentences, and meanings. They argue that the study has no role whatsoever in language teaching other than providing understanding about language conceptually for both teachers and students majoring in language studies. From the author's teaching experiences, he has found that many language learners frequently ask him this question: why should we learn linguistics? We all know that linguistics as a study which is simply focused on exploring about language theoretically (probably refers to what linguists say about language) and scientifically (probably refers to what researchers have found about language). The reality shows that such a discipline would not give significant contributions to language teaching practically. Those are what the learners say about studying linguistics.

Such an assumption is certainly misleading since one will basically be able to do something properly, if he has knowledge of what is being done. In short, knowledge is a guide to act effectively. Therefore, an effective language teacher really needs linguistics, which provides him knowledge of language, to enable him teaching a language effectively. In language teaching context, a language teacher must have right decisions in two things, namely decisions about what to teach and how to teach. The right decisions on the two things can be made when the language teacher has knowledge of linguistics views. For example, when the language teacher, from the perspective of linguistics, understands that language is one of tools of human communication, in which

the ability of communication is formed by knowledge of sounds (phonetics and phonology), words (morphology), phrases and sentences (syntax), meanings (semantics), and cultures in language usage (pragmatics), then when he teaches a language, he will focus on teaching pronunciation (phonetics and phonology), vocabulary (morphology), sentence structure (syntax), coherence of meaning (semantics), and cultures related to the use of the language is social lives (pragmatics). In addition, when the teacher understands linguistics views concerning how language learners should actually learn, he would be easy to decide a right method for teaching the learners. for instance, when the trend of communicative approach dominates linguistics views which strongly claims that communicative competence should be the representation of learners' language proficiency (Hymes 1971), many language teachers employ communicative language teaching (CLT) method as the most reliable one to acquire communicative competence (Bahar, A. K. 2013). meihua, w. (2014:71) asserts that:

Although there are still many differences between linguistics and language teaching in their attitudes towards language, their goals, and their methods, but the interaction and mutually benefited development between linguistics and language teaching definitely should not be overlooked.

Recognizing the fact, the author is then motivated to write this textbook for two main purposes, namely:

- a. To provide students majoring in English language education department with basic, comprehensive descriptions of language and linguistics.
- b. To give adequate explanations about the relationship between linguistics and English language teaching.

since the attainment of the two purposes is crucially important that the content of this book attempts to cover all considerable details of language and linguistics, which is meant to introduce the students to the core and central concepts of the fields, addressing:

- a. communication and language in human's social life
- b. The relationship between language and linguistics
- c. The major elements in linguistics
 - Phonetics
 - Phonology

- morphology
- syntax
- semantics

The selection of those materials is based on my teaching experiences of linguistics at the english education department for more than thirteen years, some useful discussions of linguistics issues with my fellow lecturers, as well as classroom interactions with my students. Hence, I am indebted to my students, colleagues and friends for so many inspiring statements, questions, discussions as well as suggestions. Those things are very valuable for making this work come into reality. Thank you from the bottom of my heart.

Makassar, September 7, 2018

kaharuddin

Acknowledgements

I would like to express my gratitude to the many people who see me through this work; especially to all my students (at **the Department of English Education, Faculty of Education and Teacher Training, Universitas Islam Negeri (UIN) Alauddin, Makassar**) who provide support and contribution for enabling me to write and to publish this book. They are:

mursida	nur syamsi
Dya salsabila	Afni Ajeng Aprilia Puspita Nur
nur r ahmah kurnia sari	dian e ldyanti r idwan
andi Pancaitana Bunga w alie	r atu faradilla faharuddin
aas Handayani	atika kelimagun
nur azisah azis	nurani

Nabila Humaira	

Thank you for your support and contribution. No benefit is bestowed in exchange for this support and contribution other than **the joy of giving** in order to **spread kindness** due to merely **seeking Allah’s Countenance**.

“And whatever you spend in good, it is for yourselves, when you spend not except seeking Allah’s Countenance. And whatever you spend in good, it will be repaid to you in full, and you shall not be wronged.” (2:272)

May Allah bless you always with happiness!

kaharuddin

CHAPTER ONE

COMMUNICATION IN HUMANS' SOCIAL LIFE

There are four ways, and only four ways, in which we have contact with the world. We are evaluated and classified by these four contacts: what we do, how we look, what we say, and how we say it.

(Dale Carnegie)

It is widely recognized that linguistics is a discipline that studies languages used by humans to communicate in their social life. In this regard, two key words need understanding i.e. the words 'communication' and 'language'. Our understanding of these two terms at least serves as the basis for understanding what linguistics is. Some of us (both teachers and students) still find it difficult to distinguish between language and communication. This consequently leads to the difficulty in understanding linguistics as well. Therefore in the first part of this book, the author makes effort to describe both concepts as the fundamental knowledge required to study linguistics more comprehensively.

1. The Word 'Communication' Defined

In social life, humans interact by sending messages to each other. The messages come from interactions between two people or more e.g. conversations and discussions, occasions delivered by people e.g. speeches and announcements, and various kinds of media that people use to transfer messages e.g. radio, television, newspapers, mobile phones as well as the

internet (arafah. B. andBahar.a.k.2015).the process of transmitting messages from a sender (e.g. a speaker or a writer) to a receiver (e.g. listener or a reader) which commonly takes place in formal or informal interactions is then known as communication. to understand the concept of communication properly, then we must firstly understand the definition of communication. There are at least two ways that can be used to find out the definition of communication. *The first way* is to search the meaning of the term in the dictionary and recognize how it is used in social life. *Another way* is to explore what communication experts and linguists say about communication. Searching the definition of communication in the online dictionaries provide us some definitions like:

- a. <https://www.merriam-webster.com> defines communication as “a process by which information is exchanged between individuals through a common system of symbols, signs, or behavior”.
- b. <https://en.oxforddictionaries.com> defines communication as “the imparting or exchanging of information by speaking, writing, or using some other medium”.
- c. <http://www.businessdictionary.com> defines communication as “two-way processes of reaching mutual understanding, in which participants not only exchange (encode-decode) information, news, ideas and feelings but also create and share meaning”.
- d. <https://www.collinsdictionary.com> defines communication as “the act of sharing or exchanging information with someone, for example by speaking, writing, or sending radio signals”.
- e. <https://www.dictionary.com> defines communication as “the process of imparting or interchange of thoughts, opinions, or information by speech, writing, or signs”.

From the definitions provided by the online dictionaries, we can obviously see that communication basically requires at least two components i.e. individuals or participants and information or news.

However, the definitions are still felt insufficient to provide us a clear understanding on what communication is. It is therefore essential that we explore another definition of communication offered by communication experts and linguists as follows:

- a. crane, I. B., Yeager, e., & whitman, r. I. (1981:3) are of the opinion that “communication is a process in which information is transmitted from a source-the sender-to a goal-the receiver”.
- b. DeVito (1986:27) states that “communication is the process or act of transmitting a message from a sender to a receiver, through a channel and with the interference of noise”.
- c. De Fonseca, M. (2000:10) regards that to communicate is “to come to share something of ourselves. It is a specific rational and emotional quality of man that arises from the need to get in touch with others, exchanging ideas that acquire meaning or meaning according to common previous experiences”.
- d. Wood. J. (2004:18) is of the opinion that communication is “a systematic process in which individuals interact with and through symbols to create and interpret meanings”.
- e. according to Hernández, a., and garay, o. (2005:31), communication is “a process of social interaction of a verbal or non-verbal nature, with intentionality of transmission and that can influence, with and without intention, in the behavior of the people who are in the coverage of said emission”.

Having read the definitions above carefully, we can then break down those definitions into several constituent parts i.e.

- communication has a process

It means that communication contains a series of ongoing actions which always change. when two people are communicating, the one who sends messages is called sender, the sender’s message is then perceived by his interlocutor who is known as receiver. since they involve in an ongoing interaction, the receiver may take his turn to be a sender, while the sender may take his turn as a receiver.

- communication has messages or information

According to DeVito(1986), message is a signal or combination of signals that serves as a stimulus for receiver. all messages use signals or symbols to transmit meaning. For example, someone feels hungry. He wants to transmit the information (what he is feeling). He or she must first put that information into symbolic system of a language. If he puts the information in symbolic system of English, he will say”I am hungry”.

- communication has channels
A channel refers to a medium to send messages. The medium can be in the form of light, air, or ink. for example, speaking and listening use air, and writing uses ink, etc.
- communication has a mode
In communication, a sender may choose a mode of communication when conveying his messages e.g. verbalizing, writing, or miming his messages.
- communication has meaning decoding
When a sender is sending his messages using symbols, the receiver must make effort to decode the symbols. In this case, nothing is communicated unless the receiver is able to decode the meaning contained in the messages. In a spoken discourse, one must be able to know the individual words, grammar of the language, and finally comprehend the meaning of the messages.

all the constituent parts of communication are illustrated in the following figure

Source: Image credits © Manoj Patil

we can now proceed to define the word ‘communication’ from all definitions we have seen above. Communication may be defined as an interactive process of sending symbols or messages through a particular medium and mode from a sender to a receiver in which the receiver makes effort to decode the symbols for interpreting the intended meaning sent by the

sender. For example: As a newborn baby is crying, he seems to communicate a certain message very effectively with his mother, A certain cry given by the baby is known well to the mother after decoding it. The mother is then able to interpret the meaning behind the cry that her baby is hungry or tired.

2. Human Communication Systems

As stated earlier that humans communicate by using symbols. With these symbols, they are able to produce an unlimited number of messages. The ability of humans using these symbols to communicate is demonstrated in three ways, namely: communicating messages by using symbols in speech, communicating messages using symbols in writing, and communicating information using symbols in gestures. The reality shows that, humans are more dominant using speech as the main communication system. next, using writing in the second position. However, writing allows the preservation of communication over space and through time (crane, I. B., Yeager, e., & Whitman, R. L. 1981). There have been so many findings about the history of the development of mankind history revealed through messages of written symbols from the past. Furthermore, gesture is a complementary communication system used by humans, especially among the deaf. Of course this third communication system is also used by humans in general to complement their ability to communicate through speech. The following discussions present a comprehensive description of the three communication systems used by humans in their social lives.

2.1. Speech Communication System

speech is produced when we are speaking. It requires articulating and combining segmental (e.g. vowel and consonant sounds) and supra-segmental sounds (e.g. stress and intonation) produced by functioning our speech organs such as mouth, teeth, lips, tongue, nose, and throat. In this regard, kaharuddin and ahmad. d. (2018) are of the opinion that speech is produced when a speaker is using his articulators to utter sounds started from flowing the air provided by the lung, the air then goes through the glottis in the larynx that then is modified by the vocal tract (oral cavity) or vocal apparatus (nasal cavity) into different quality of sounds i.e. consonants and vowels. The speech, that we produce when speaking, basically contains a

series of symbols contain meaning, the meaning is conveyed starting from incorporating segmental and supra segmental sound sequences, they are then strung together into words, the words are then arranged and constructed into sentences, the sentences are finally spoken to deliver the meaning existing in our mind. In this regard, Warren, P. (2012) is of the opinion that from the language producer's (speaker's or writer's) perspective, the production of a message takes us from an underlying intention, through stages of planning sentences structure and selecting words, to the articulation of that intention as a sequence of sound or letters. Chomsky, N. (2006) calls this phenomenon as a 'competence'. According to him, everyone must have three types of linguistic knowledge in order to be able to produce speech i.e. knowledge of semantical rules, knowledge of syntactical rules as well as knowledge of phonological rules. Each of the knowledge is described as follows:

a. Knowledge of semantical rules

Knowledge of semantical rules refers to the knowledge that a speaker has, to be able to formulate the meaning in his mind to be conveyed. In psycholinguistics, such knowledge is also referred to as abstract ideas (intention or concept). Warren, P. (2012) states that as speakers, we start with some notion or abstract ideas of what we want to say, without at first generating the words or sentences to express this. This is a process of conceptualization, during which we use what we know about the world, about the current situation etc. So everyone who will produce meaningful speech must at first have underlying meaning (abstract ideas) carrying in mind. This semantic knowledge is the initial stimulus in speech productions which has no language properties. It is a concept formulated in a speaker's head. The knowledge of semantic is affected by several rules such as:

- The speaker's decision about what to say.
- Facts about the situation
- Understanding of how communication works by considering specific aspects of messages need to be highlighted

(Warren, P. 2012)

Take a look at the following example to see how the rules govern the knowledge of semantic (concept) in a speaker's mind before addressing messages.

Figure 2.

Source: <https://www.dreamstime.com>

The figure shows the following situations:

- The man wants to convey an idea from a situation that a dog chased a cat as shown in figure 2. It refers to the first rule i.e. the speaker's decision about what to say.
- Before the man verbalizes the situation, he firstly conceptualizes what he sees in the form of meaning (abstract idea). The conceptualization takes place by involving at least three concepts i.e. the first is the concept of chasing as an action (pursuing someone or something in order to catch), the second one is the concept of a dog as a subject (the animal carrying out the action of chasing), the third is the concept of a cat as an object (the animal on which the action of chasing is carried out). It refers to the second rule i.e. the facts of the situation.
- Besides, the man also needs to include information about which facts (concepts) need to be highlighted whether he wants to focus on highlighting the dog as the subject, the action of chasing, or the cat as the object. This refers to the third rule i.e. understanding of how to communicate the messages.

Specifically, Warren. P. (2012) explains that the implementation of the semantical rules formulation can be categorized into two types of semantical planning i.e. semantical macro-planning and semantical micro-planning. semantical macro-planning refers to the action of a speaker to decide what speech acts should be used to communicate the concepts his in mind well. Clark (1996) defines speech acts as an

action chosen in conveying a concept whether by asking, asking for information, requesting, etc. In addition, semantical micro-planning refers to the determination of the type of speech acts that will be used for communicating ideas and which facts will be highlighted as the core topic to be conveyed to the interlocutors. The important thing to note is that both types of semantical planning are still not language, but is still concepts in mind that still have to be converted into language products.

b. Knowledge of syntactical rules

knowledge of syntactical rules refers to a speaker's skill of putting together the properties of language i.e. lexical and grammatical property that will express his abstract concepts (meaning in mind). This process of converting meanings or concepts into sentences by using lexical and grammatical property is also known as formulation. formulation commonly takes place when the speaker has the following syntactical knowledge i.e.

- knowledge of lemmas

As a speaker needs to verbalize the meaning or concepts in his mind, then he must at first be able to connect between the facts he sees and the words whose meaning corresponds to the facts. In other words, he must be able to access words which semantically correspond to the facts. the semantic aspects of words are also called 'lemmas' (Warren, P. 2012).

- knowledge of lexemes

Hereinafter, the lemmas are link to the form of words. the forms of words (spoken or written forms) used to represent the facts are known as lexemes.

- knowledge of grammatical encoding

Finally the lexemes are put together into sentences by using the speaker's implicit knowledge of grammar to construct coherent sentences that will express the concepts in his mind. Producing coherent sentences by using knowledge of grammar to convey messages is known as grammatical encoding. In this case, grammatical encoding plays a decisive role in turning a meaning into a language. according to Garret, M.F. (1980), grammatical encoding involves two separated, but interrelated processes i.e. functional

processing and positional processing. functional processing refers to the act of giving appropriate jobs to the selected lemmas (words which will convey the speaker's intended meaning). For example, a boy intends to convey an abstract idea regarding the situation in figure 3.

Figure 3.

Source: <https://www.dreamstime.com>

The boy might select three lemmas i.e. woman, car, and wash. If the boy gives a job to the lemma 'woman' as a subject, the lemma 'car' is an object, and the lemma 'wash' as an action, he will make a sentence in a structure like: 'woman + wash + car'. It is known as an active sentence in which the boy highlights the lemma 'woman' as the topic of information. However, the sentence structure will be different if the boy gives different jobs to the lemmas from the first sentence structure such as the lemma 'car' as the subject, and the lemma 'woman' as the object. So, the sentence structure will be 'car + washed + woman'. It is then known as a passive sentence in which the boy highlights the lemma 'car' as the topic of information. In addition, positional processing refers to the act of selecting a set of lemmas to be organized into an ordered and grammatical string of sentence. In this case, the boy is required to give appropriate grammar to the lemmas immediately after giving the jobs to them such as giving tenses, correct verb agreement, appropriate article. So, the possible sentences constructed based on the lemmas in the situation are:

- t he woman washes the car (simple present tense-active)
- t he woman is washing the car (present progressive tense-active)
- t he woman washed the car (simple past tense-active)

Since the boy gives the job ‘subject’ to the lemma ‘woman’, so the focus of information is on the woman. If the boy gives the job subject to the lemma ‘car’, so the focus of information is on the lemma ‘car’ which results in the sentence structures like:

- the car is washed (simple present tense-passive)
- The car is being washed (present progressive tense-passive)
- the car was washed (simple past tense-passive)

after lemmas go through grammatical encoding involving functional processing and positional processing, sentences structures which represent the abstract ideas have been created and get ready for phonological encoding.

c. Knowledge of phonological rules

knowledge of phonological rules refers to the skill of allowing the lemmas to be linked to the lexemes, which have been conceptually constructed into sentence structures, is converted into the appropriate sound sequences to express the messages (articulation). as for Chomsky (2014), this phenomenon is also known as the transformation process from deep structure into surface structure. Deep structure may be defined as the semantic aspects that a speaker has in mind. on the other hand, surface structure may be defined as the representation of deep structure that we can see and hear. according to Fernandez, E. M. & Cairns, Helen Smith (2011), knowledge of phonology of a language is essential because it is the component of the grammar that specifies what sound units the language uses to make words, and how those sound units are combined into syllables, words, and intonational phrases. This knowledge allows a speaker to build words in the form of articulated sounds which is done by using implicit two-stage approaches to phonological acquisition i.e. the first, identifying phonetic-level categories, and then using those categories to discover phonemic categories (Dillon, B., Dunbar, E., & Idsardi, W. 2013). In this regard, Bruce Hayes (2009) explicitly states that knowledge of phonological rules enables a speaker to convey messages from the abstract representation stored in their brain, to the actual sound they articulate when they speak about the messages. In other words, we could say that the application of phonological rules starts with the process

of finding the lemmas' *soundunderlying representations* (the phonemes that are stored in the speaker's mind) and to the process of building the *surface form of the lemmas*, or what the speaker actually pronounces. Hayes, B. (2009) further suggests that phonological rules in general have the following characteristics, among other things:

- **Phonological rules are intuitive:**

It means that the rules give speakers intuitions about what words are "well-formed" or "acceptable"; if a speaker hears a word that does not conform to the language's phonological rules, the word will sound foreign or ill-formed.

- **Phonological rules are untaught and unconscious:**

It means that speakers apply these rules without being aware of it, and they acquire the rules early in life without any explicit teaching.

- **Phonological rules are language specificity:**

It indicates that a phonological rule that is present in one language may not be present in other languages, or even in all dialects of a given language.

- **Phonological rules are language productivity:**

It indicates that phonological rules apply even to new words. For example, if an English speaker is asked to pronounce the plural of the nonsense word "wug" (i.e. "wugs"), they pronounce the final *s* as [z], not [s], even though they have never used the word before. (This kind of test is called the wug test.).

Conclusively, knowledge of phonological rules enables a speaker to carry out a phonological encoding process, which allows him/her to articulate the lexemes considered as the appropriate sound sequences to express the meaning in his/her mind.

Basically, it is generally agreed that human speech communication system is shaped by the three types of linguistic knowledge. However, differences still exist in determining the underlying rule of speech production. According to Chomsky (1968), the knowledge of syntactical rules is the central. He further states that sentences are principally constructed within the syntactic components, while semantics and phonology are interpretive. In other words, the rules of phonology and semantics operate on the product of the syntactic component to cloth it with sound and to make sense out of

it (Crane, L. B., Yeager, E., & Whitman, R. L. 1981). Chomsky names this theory as the standard Interpretive theory. The organization of the theory is represented in figure 4, as follows.

Figure 4
Chomsky's view on Competence in Speech Communication System
Source: Crane, L. B., Yeager, E., & Whitman, R. L. (1981).

On the other side, the centrality of syntax in sentence formation is still in debate among the linguists particularly those who belong to transformative generative grammarians. Some of them, such as John Ross, George Lakoff, Paul Postal, James McCawley and others, propose the alternative view on sentences production in human speech system which is called generative semantics theory. This theory holds that in sentences production, syntax rule is not the primary. The primary one is semantics or meaning. The rules of syntactical and phonological provide shapes and sounds patterns which are used to express the meaning. The organization of the theory is illustrated in figure 5 as follows:

Figure 5
The theory of Generative Semantic Competence
Source: Crane, L. B., Yeager, E., & Whitman, R. L. (1981).

apart from the two different views on the production of speech in humans' communication system, many views on psycholinguistics, such as Garret (1980), Levelt et al. (1999), as well as Warren, P. (2012) support the theory of generative semantic competence. Warren (2012) for example specifically states that:

As speakers, we start with some notion or abstract idea of what we want to say, without at first generating the words or sentences to express this. This is a process of conceptualization, during which we use what

we know about the world, about the current situation etc, in order to sort out our ideas. we then need to put together the elements of language than will express the idea, drawing our knowledge of our language, including grammar and the lexicon (vocabulary). This involves a process of formulation. finally, in order to speak this utterance, we go through a process of articulation, involving our speech apparatus.

figure 6 illustrates the processes and the knowledge involve in speech productions as follows:

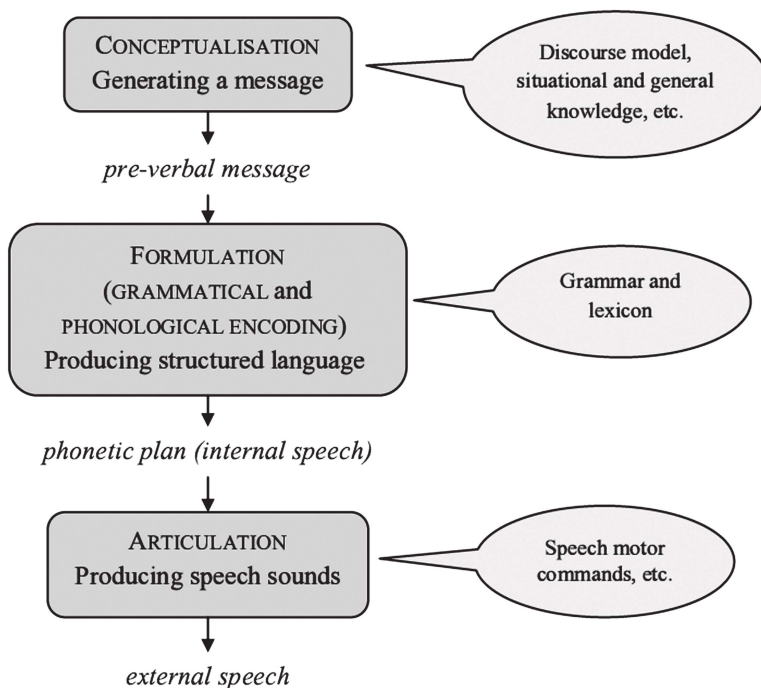

Figure 6
Humans' speech production process
Source: Warren, P. (2012)

after learning and knowing how the speech communication system used by humans and the types of knowledge required to produce speech in communication, then mastering these three types of knowledge should be a priority in the process of teaching and learning a foreign or a second language. It is believed that the mastery will provide competence in speech communication system. Furthermore, the following discussion is specifically focused on writing as the second type of humans' communication system.

2.2. Writing Communication System

In addition to speech, writing is the second communication system commonly used by humans in their daily interactions. Writing as a communication system may be defined as a tool to communicate humans' abstract ideas and emotions by using coherent signs or symbols in the form of texts. Writing is regarded as complementary medium to speech used to transfer messages in written forms in order to be understood by readers. Therefore, linguists are generally more interested in exploring speech than writing due to three main reasons i.e.

- Writing is often viewed as a reflection of speech (Crane, L. B., Yeager, E., & Whitman, R. L. 1981).
- Many reports of observations e.g. Wilkinson (1965), James Britton (1983) show that children acquire their ability to speak and to listen before they acquire their ability to read and to write.
- Human brains are naturally wired to speak; they are not naturally wired to read and write (Moats, L., & Tolman, C., 2009).

As a language communication system, writing not only requires linguistic knowledge the same as what speech has e.g. lexical, syntactical, as well as semantical knowledge, but it also requires some other types of practical knowledge such as knowledge of writing content, knowledge of writing organization, and knowledge of writing style. This idea highlights the fact that writing is in principle the representation of four kinds of knowledge i.e. knowledge of content, knowledge of linguistics, knowledge of organization, as well as knowledge of style. In this regard, as one wants to communicate his abstract ideas (intention) in written form, so he/she has to use the four types of knowledge that work together in a piece of writing (texts). The effectiveness of such a communication is much determined by how good the person's knowledge of the four types of knowledge is. If any of the knowledge is weak, his/her communication will not be effective. It is important to highlight that being effective in this context means that the person is successful in both transferring and communicating his/her intended information.

a. Knowledge of content (Information)

Content refers to the information available in a written text. As someone chooses writing communication system to express his/her ideas, he/she needs to make sure ideas (topics) he/she intends to convey. For

example, if he/she wants to write about a luxurious house as a topic to write, he/she must have sufficient prior knowledge in order to be able to give information about it. The prior knowledge of the luxurious house can be acquired through reading, listening, or doing something to get understanding about it. Therefore, having knowledge of content takes time and efforts. Writing the information concerning the house can then be provided in some ways e.g. to explain how to build a luxurious house (process), to present an argument about the effect of having a luxurious house on the owner's life style (cause and effect), to point out the distinctions between a luxurious house and a simple house (comparison), to describe what a luxurious house looks like (description), and to tell a story about buying a luxurious house (narration) etc. Having knowledge of content certainly enables a writer to expose information in a written text effectively because he/she exactly knows what to express based on his/her prior knowledge of something.

b. Knowledge of linguistics (Words, spelling, grammar)

Knowledge of linguistics refers to the ability to encode information into language components such as words, phrases, sentences by using correct spelling, word selection and grammar. As a writer formulates concept/information and wants to develop it into a written form, he/she must use his/her linguistic knowledge in order to be able to transform it into paragraphs or texts. The writer needs to be aware of utilizing the linguistic knowledge appropriately. Once he/she inappropriately uses the knowledge, for example, misspelling a word, it might cause a word's meaning to change (e.g. break vs. brake, weather vs. whether) or to fall into a different variety of English (e.g. color: AmE vs. colour: BrE, organize: AmE vs. organise: BrE). Therefore, to write effectively, the writer will have to edit his/her writing for punctuation, spelling, word selection and sentence structure according to the rules of standard English grammar. From the perspective of linguistics, the knowledge that someone has about the language (e.g. grammar, lexis, syntax, etc.) is known as competence. As he/she uses the competence to produce appropriate actual production of language (e.g. speaking or writing), it is then known as performance.

c. Knowledge of organization (Way of organizing information)

Knowledge of organization refers to the ability to organize sentences and paragraphs in a good order that a piece of writing is easy for readers to follow. There are at least two basic structures used to organize a piece of writing i.e. sentence structure and paragraph structure. Sentences written in a good structure can be split into two elements: Theme and Rhyme. According to Halliday (1994), theme is given information serving as “the point of departure” of a message. The given information is the information which has already been mentioned somewhere in the text, or it is shared or mutual knowledge from the immediate context. In other words, theme typically contains familiar or already known information. Theme provides the settings for the remainder of the sentence that is rhyme. Rhyme is the remainder of the message in a clause in which theme is developed, that is to say, rhyme typically contains unfamiliar or new information. New information is knowledge that a writer assumes the reader does not know, but needs to have in order to follow the progression of the argument (Yang, 2008). According to Kaharuddin, and Latif, I (2017), the distinction between Theme and Rhyme is simple: theme is the first element occurring in a clause or also known as topic; the remainder clause which clarifies the topic is rhyme or also known as comment. Besides, a piece of writing can run into many paragraphs. A good paragraph must contain at least three basic organization patterns i.e. The first: an introductory sentence in which a thesis is given. The second: supporting sentences which present evidences to support the thesis. The third: concluding sentences which look back to the thesis and sum up the important points available in the previous paragraphs.

d. Knowledge of style (Way of expressing information)

Knowledge of Style refers to the ability to arrange paragraphs in a good text structure. Text structure may be defined as the way that the information within a written text is organized. Recognizing text pattern is beneficial to both readers and writers. From readers' perspective, text pattern can help the readers to see clause relations from one to another which can be used to interpret a text to gain comprehension. While from writers' standpoint, knowledge of text patterns allows the writers to satisfy their readers with a natural English text structure, expected

to be familiar and the norm for international readers. Hoey (2001) states 'culturally approved patterns greatly simplify the reader's task in seeking a linear path through a non-linear network'. therefore, the primary role of approved text patterns is to enhance learners' skills in writing english texts naturally through the support of their knowledge of lexical and grammatical devices. there are three types of the most common macro patterns in English texts i.e. the 'Problem-Solution', the 'General-Specific' and the 'Claim-Counterclaim' patterns, which another commonly developed pattern is that of 'Question-Answer' (Hoey, 2001, Coulthard, 1985, McCarthy, 2001).

with regards to the four types of knowledge of writing as communicating system, Kellogg, R. T., & Paulson, B. A. (2007) are of the opinion that knowledge of correct spelling, punctuation, grammar, diction, thesis statements, topic sentences and cohesive links within a paragraph, and global organization of texts are necessary for effective writing. therefore, it is said that the effectiveness of using writing as human communication system is much affected by the mastery of the four types of knowledge.

2.3. Gesture Communication System

a gesture is also recognized as a non-verbal/vocal communication system in which parts of human body such as fingers, hand movements, as well as face are used to communicate certain information (messages) in human social interactions, either used to replace speech or used to accompany speech. according to Bernardis, P., & Gentilucci, M. (2006), there are two kinds of perspectives regarding gesture. The first perspective views gesture as an independent communication system which is separate from speech. this view posits that gesture is utilized as an auxiliary support (co-speech) when a speaker finds it difficult to convey verbal expression or to retrieve words in spoken language. the second one regards that gesture and speech collectively shape a single system of communication, since they both are connected to the same thought processes taking place in mind although they use different modality expression to convey messages. therefore, gesture allows individual to communicate his/her ideas, feelings, thoughts in mind without using a language in the form of speech. Using the first perspective, gesture is then studied in the field of communication, rhetorical discourse

and public speaking. Besides, the second view allows gesture to be studied in the field of linguistics. With regards to the two perspectives of gesture, Abner, N., Cooperrider, K., & Goldin Meadow, S. (2015) name the first view as informative gesture and the second view as communicative gesture. Informative gestures also known as passive gestures give information concerning the speaker as a speaking style serving as co-speech, and not concerning messages that the speaker intends to communicate e.g. hands and arms movements, head nodding and shaking, shoulder shrugging, as well as facial expressions. on the other hand, communicative gestures are intentionally and meaningfully made by an individual as a way of communicating messages by using his/her hands as sign languages alternative to speech in spoken language. Note that sign languages may be regarded as the representation of communicative gestures.

This type of gesture is recognized as a sign language since it consists of language components which are formed as a modality to convey meaning, in which meaning is expressed through sign stream using hands as a combination of its own grammar and lexicon. Linguists consider that sign languages are also types of natural languages which are primarily developed and used among communities of deaf people and hearing people who are unable to speak physically. Even if sign languages develop their own grammar and lexicon, they are not universal and not mutually intelligible. According to Bellugi, U., & Klima, E. S. (1979), many linguists have studied a large number of sign languages and found that they possess the basic properties available in all spoken languages such as transitoriness (planning-formalization-production), semanticity (meaning-form), arbitrariness, productivity, and cultural transmission. In terms of language components, sign languages have manual alphabet, lexicon, and grammars. Therefore, deaf people as the users of sign languages need to learn the sign language components in order to be able to communicate one another.

a. The Manual Alphabets of Sign Languages

Manual alphabets of sign languages are widely known as Fingerspelling (or dactylogy). fingerspelling is regarded not only as the representation of the letters of a writing system, but also numeral systems, using only the hands which function to borrow words from spoken language by simply spelling out the letters. The fingerspelling is commonly used to

communicate proper names such as people and places names. according to Carmel, S. J. (1982), there are approximately forty manual alphabets around the world which are adopted and learnt in deaf people education. The manual alphabets have two families utilized to represent alphabets of spoken language i.e. one-handed fingerspelling (commonly used in american sign language, Irish sign language, as well as french sign Language) and two-handed fingerspelling (commonly used in British sign language, australian sign language, new Zealand sign language: BAN). Here are the examples of both manual alphabets (fingerspelling):

Figure 7
Two-Handed BAN-Sign Languages

Figure 8
 One-Handed American Sign Languages
 Source: <https://www.lnhspanthers.com>

b. The Lexicon of Sign Languages

In order to communicate messages, a sign language user (called a signer e.g. deaf individual) can build words (signing vocabulary) by using fingerspelling movements. For example, to communicate a message about MOBILE, the signer can spell the word with rapid finger spelling as indicated in the following figure:

Figure 9
 Making up the word 'MOBILE' with rapid fingerspelling
 Source:Thumann, M. A. (2012)

However, thumann, m. a. (2012) report that when two signers are communicating by using fingerspelling, many fingerspelled words do not have clearly identifiable letters. The fact is relevant with Akamatsu, C. T. (1985)who also reports that although the fingerspelling may seem unintelligible when looking at individual letters, a fingerspelled word is intelligible when viewed as a whole word. In this regards, Zakia, R. D., & Haber, R. N. (1971) also state that skilled signers do not really concern with individual alphabet in a fingerspelled word, but with the pattern of the finger configuration. Therefore, the process of building the words requires knowledge of fingerspelling, knowledge of lexicalized signs, and knowledge of the sign language lexicons.according to Battison, R. (2003), lexicalized signs are fingerspelled words which have been restructured and assume the same formational patterns as the other signs of sign languages based on a convention. On the other hand, the lexicons of sign language consist of the signs, lexicalized fingerspelling, facial expressions, and loan-signs, as well as the head, shoulder, and torso movements (which have established meanings) in the sign language. In the case of deaf children, many of them have limited knowledge of communicating using sign language. for the reason, they are required to firstly study the manual alphabets, then study the lexicalized signs, and finally study sign language lexicons. After the deaf children have

sufficient knowledge of fingerspelling, they should start learning how to build basic sign vocabulary by finding the most important words which have been categorized as the most often used categories such as Common words, animals, colors, descriptions, family, food, Home, People, Questions, School, and Time. One thing to keep in mind that this is just the beginning which allows the signers only learn the most common basic signs used in sign languages. and, of course, there is more things to learn about Sign Language than just building vocabulary. Sign language has other important things to learn such as its grammar, syntax, and culture.

c. **The Syntax of Sign Languages**

Syntax may be defined as a study which is focused on examining sentence structure in a language. It mainly describes how words are put together to make phrases or sentences. as everyone knows that every language has its own syntax or rules of word structure in a sentence. for example, the syntax of English may be described in the word order like: The subject + action +object. With regards to sign language, it has its own syntax as well which is very important to learn by those who are not able to communicate by using speech. According to Bahan, B. J. (1997), sign language can be categorized as an SVO language, even if the word order is sometimes replaced by a process called Topicalization. The structure of topicalization is t opic + comment, in which t opic is also known as Subject and Comment is also known as predicate can be in the form of statement or question. for example:

English : I am a teacher
 sl : I teac Her
 t opic + c omment

Here are some of examples of sign language characteristics:

- Sign language does not recognize ‘to be verb’
 for example:
 English : He is my father
 sl : He mY fat Her
- Tense in sign language is marked by using adverb of time (no verb agreement)

for example:

English : John bought a book yesterday

sl : JoHn BUY B ook Yesterda Y

- Positive statement is marked by nodding head

for example:

English : Jerry loves tom

sl : tom, Jerr Y loVe

- Negative statement may be signaled by shaking head during stating the statement.

for example:

English : I don't have any dogs

sl : dog, I Ha Ve none

the discussion concerning the communication system of gesture presented in this section is not described in detail because it simply aims to show that gesture in term of communicative gesture (sign language) is really one of human natural languages in addition to spoken language. It is said a language since it has its own language components such as phonology (using fingerspelling instead of sound), morphology (sign vocabulary), syntax (sentence structure), semantics (meaning which is displayed by the use of phonology, morphology, and syntax), as well as pragmatic (the cultural aspect of the language usage).

CHAPTER TWO

LANGUAGE AND LINGUISTICS

The development of language is part of the development of the personality, for words are the natural means of expressing thoughts and establishing understanding between people.

(Maria Montessori)

At the beginning of this section, it is important to emphasize here that the term ‘language’ is restricted to spoken language as the most dominant communication system used by humans in their social life. Besides, we use theoretical views from the field of linguistics to describe the picture of language in that context.

1. The Word ‘Language’ Defined

As stated earlier that humans have two types communication systems i.e. verbal communication system (i.e. speech and writing communication systems) and non-verbal communication system (i.e. gesture communication system which is also recognized as communicative gesture or sign language). It indicates that language may be seen as one of communication systems used by humans to interact one another in their social lives. In this regard, one important question to answer is ‘what is language?’ This question becomes very important to answer since we will not find it easy to understand what linguistics is, unless we understand the definition of language properly. In my experience of teaching university students at the English education department, many

of the students who have taken the course of linguistics still find it very difficult to give proper understanding on what language is. This consequently affects their proper understanding on linguistics as well. As I address a question to the students like: what is language? can anyone say something about this question? The most frequent answer they give is that language is a communication tool. This is it. Of course, if I further ask them another question like: If so, what is linguistics? the most frequent answer I get is that linguistics is the study of language. If I address my last question like: So, what is the relationship between language and linguistics? I frequently get no acceptable answer from them. Therefore, I again need to emphasize that it is essential to provide comprehensive definition of language in this section to allow the students have proper understanding on linguistics and its relationship to language.

To give comprehensive definition of language, let's first of all take a look its definition from two different sources i.e. online dictionaries and linguists' theories. If we search the definition of language carefully in online dictionaries, we will find the definitions of a language as follows:

- <https://www.collinsdictionary.com> gives the definition that “a language is a system of communication which consists of a set of sounds and written symbols which are used by the people of a particular country or region for talking or writing”.
- <https://en.oxforddictionaries.com> provides the definition that “a language is the method of human communication, either spoken or written, consisting of the use of words in a structured and conventional way”.
- <https://www.merriam-webster.com> defines “a language as a systematic means of communicating ideas or feelings by the use of conventionalized signs, sounds, gestures, or marks having understood meanings”.
- <https://dictionary.cambridge.org> offers the definition that “language is a system of communication consisting of sounds, words, and grammar, or the system of communication used by people in a particular country or type of work”.
- <https://www.dictionary.com> gives the definition that “language is communication by voice in the distinctively human manner, using arbitrary sounds in conventional ways with conventional meanings; speech”.

- <https://www.thefreedictionary.com> defines language as “the communication of thought and feelings through a system of arbitrary signals, such as voice sounds, gestures, or written symbols”.

In addition to the definitions given by the online dictionaries, it is also important that we see the definitions of a language provided by the linguists, among other things:

- According to Sapir, E. (1939), “Language is a purely human and non-instinctive method of communicating ideas, emotions and desires by means of voluntarily produced symbols”.
- Bloch, B., & Trager, G. L. (1942) state that “language is a system of arbitrary vocal symbols by means of which a social group co-operates”.
- Hall Jr, R. A. (1968) is of the opinion that “language is the institutions whereby humans communicate and interact with each other by means of habitually used oral-auditory arbitrary symbols”.
- Chomsky, N (1957) points out that “a language (is) a set (finite or infinite) of sentences, each finite in length and constructed out of a finite set of elements”.
- Lyons, J. (1981) defines “a language as a system of symbols designed, as it was, for the purpose of communication”.
- Crystal, D. (1992) defines “language as humans’ vocal noise (or the graphic representation of this noise in writing) used systematically and conventionally by a community for purpose of communication”.
- Poole, S. C. (1999) is of the opinion that “language is generally considered as a form of communication between human beings by means of a system of symbols which are principally transmitted by vocal sounds”.
- According to Hazen, K. (2014), “language is the discrete combinatorial system humans use most for communication. *Discrete* means ‘separate’ here, and *combinatorial* means ‘ability to add together.’ We take small separate parts, push them together in specific combinations, and create larger parts of language”.

Referring to the definitions as provided either by the online dictionaries or by the linguists, we can obviously see some fundamental properties of language which are mutually shared in the definitions i.e.

a. Language is a method (a system) of communication

as everyone knows that language is one of human communication methods. Language is called as a method because it is a systematic way of communicating messages in humans' social lives. as one of communication methods, a language contains a set of things working together to deliver messages from a speaker to a listener. the things are known as language elements which serve as essential parts to form a method of communication called a language. the language elements are sounds, words, phrases, sentences which contain meanings. In order to communicate using a language, the elements must work together as a system. when all parts of the language elements function properly, communication will be taking place effectively. The representation of the functional elements of a language working together as a system can obviously be seen when an individual is effectively speaking to his/her listener in an interactional event. Poole, s. c. (1999) points out that the elements of language as a system provide humans with the framework which allows them to generate appropriate utterances and to create utterances never uttered before that the utterances produced by humans are not ready-made utterances. In a nutshell, when we say 'language as a system of communication', it means we are talking about what parts of language we use to communicate meanings.

b. Language is used by humans

In my linguistics class, I usually ask my students, do animals communicate by using a language? As usual, many of the students say 'yes, animals have language'. why is that? the answer to the question is very simple. the students do not have a clear understanding on what language is. all they know is that language is simply a means of communication. For the reason, they believe that animals have language. Of course, the students' answer would be NO, if they had proper understanding about what language is. If we refer to the previous idea in point (a) above that language is a system of communication which contains functional elements such as sounds, words, phrases, sentences, and meanings. we will eventually realize the fact that animals do not communicate by using languages because the animals' communication system does not have properties as humans' language have. therefore, we

can say that animals communicate with each other, and sometimes with us. But the means that the animals use to communicate is not language. It is simply a signal in the form of a gesture, action, or sound that is used to convey information. In linguistics, such signals used by animals to communicate are called semantic universality. so, communication is where the similarity between animals and humans starts, but language is where the similarity between animals and humans ends. As we can see that animals clearly communicate with one another by using signals such as whale sing, monkeys howl, birds chirp. Lizards bob their heads up and down to communicate. The animals really communicate, but none of these processes can be explained as a language because signals that the animals use to communicate do not have properties like what languages have. a monkey screams to warn its mates of an approaching predator. The monkey uses its sound as a signal of a danger, but it can never communicate sounds like “come on, run away into the forest, a crocodile is approaching us” On the contrary, an individual, by using a language, has an ability to convey information which is relevant to a particular context, feeling, experience as well as thought. t herefore, it stands to reason for saying that language is only used by humans for the purpose of communication.

c. Language functions to communicates meanings (messages) from thoughts and feelings

When someone is expressing his/her ideas from thoughts or feelings by using a language, he/she intentionally uses his/her language knowledge to speak i.e. Phonological (sounds), morphological (words), syntactical (sentences), semantical (meanings) as well as pragmatical knowledge (cultures). t he question is: what knowlededge is used at first, then followed by what, and ended by what? According to Chomsky’s ideas (2006) on language competence (knowledge of language) and language performance (ability to use the knowledge), a speaker speaks by using his language competence and his ability to use the knowledge structurally to produce speeches i.e. meaning (semantic), words (morphological), phrases and sentences (syntactical) and uttering the meaningful sentences by using sounds (phonological). As the speaker uses all his language knowledge in a systematic procedures employed to produce speech.

The speech is then produced in its final form that is meaningful ideas which are communicated to the speaker's interlocutor. so, a speaker uses meaning to convey his ideas, and a listener encode the sequence of sound to obtain meaning sent by the speaker. If so, the essence of language is meaning. as an individual intends to communicate meanings to the others, he/she may choose one of verbal communication channels i.e. spoken or written.

d. Language is constructed from conventionalized elements or symbols such as sounds, words, sentences, and meanings.

Whitehead, A. N. (1985), in his work entitled *Symbolism: its meaning and effect*, writes that language, written or spoken, is such a symbolism. The mere sound of a word, or its shape on paper, is indifferent. The word is a **symbol**, and its meaning is constituted by the ideas, images, and emotions, which it raises in the mind of the hearer. In short, a language is symbols. Why is that? Now, let's take a look at the definitions of symbol provided by online dictionaries, among other things:

- <https://www.merriam-webster.com> defines "symbol as something that stands for or suggests something else by reason of relationship, association, convention, or accidental resemblance".
- according to <https://www.dictionary.com>, "symbol is defined as something that represents something else by association, resemblance, or convention".
- <https://en.oxforddictionaries.com> defines "symbol as a mark or character used as a conventional representation of an object, function, or process".
- according to <https://dictionary.cambridge.org>, "symbol is a sign, shape, or object that is used to represent something else".

notice, when a speaker of a certain language is speaking, he/she is essentially using symbols in terms of sounds, words, phrases, and sentences. those language components are used to represent meanings (messages) from the speaker's feeling and mind. so, the reasons for saying that the language elements (such as sounds, words, phrases, and sentences) are symbols since they are used to represent the speaker's (intended meanings) messages in communications. In order to make the symbols communicating to the speaker's hearer, both parties must share the same values regarding the

symbols. Sharing the same rules or values is called conventional. Therefore, it is very difficult for two individuals who do not share the same values of the symbols to communicate. Since communication using languages has two channels i.e. spoken and written, so there are two kinds of symbols used. If an individual is speaking to express messages, so the individual is using vocal symbol. Besides, if an individual is writing to convey information, so the individual is using visual symbol.

Having considered all the definitions and the fundamental properties of language as described above, language may be then defined as a method (a system) of communication used by humans to communicate meanings (messages) from thoughts and feelings, which is constructed from conventionalized elements or symbols such as sounds, words, phrases, sentences, and meanings.

2. The Origin of Language

first of all, it is important to emphasize that the terms ‘the origin of *language*’ in this section refers to theories which describe to the emergence and development of language in humans’ social lives. Discussing about the origin of language is never easy because we simply do not know, and never will, how or when language began (Campbell, B. G. 2005). Many efforts have been carried out to describe about it, the efforts however have failed due to the lack of knowledge regarding the origin of any language (Harrub, B., Thompson, B., & Miller, D. 2003). nevertheless, there is no harm in presenting such a short discussion in this work to answer many students’ curiosity about the origin of language since many students in my linguistics class frequently address the question regarding the origin of language. according to Fromkin, V., Rodman, R., & Hyams, N. (2003), there are at least three theories suggested to describe the origin of language i.e. the theory of divine origin, the theory of evolutionary development, and the theory of language as a human invention.

2.1. The Theory of Divine Origin

many societies (from the past to the present) whose people have religions, believe that language is God’s gift to mankind. Each of the societies’ religion has its own explanation that language is really granted to humans by God. In Islam, it is believed that Allah The Almighty taught Prophet Adam the names

all of things which might be interpreted that Allah The Almighty is the source of language who provides Prophet Adam (as the first human created by Allah The Almighty) with language. This can be seen in the Holy Quran surah Al-Baqarah (the cow) verse 31:

وَعَلَّمَ آدَمَ الْأَسْمَاءَ كُلَّهَا ثُمَّ عَرَضَهُمْ عَلَى الْمَلَائِكَةِ فَقَالَ أَنْبِئُونِي بِأَسْمَاءِ هَٰؤُلَاءِ إِنْ كُنْتُمْ صَادِقِينَ ﴿٣١﴾

And He taught Adam the names - all of them. Then He showed them to the angels and said, "Inform Me of the names of these, if you are truthful."

Besides, similar statement is also found in surah ar-r ahman, verse 3 and 4:

خَلَقَ الْإِنْسَانَ ﴿٢﴾

Created man,

عَلَّمَهُ الْبَيَانَ ﴿٤﴾

(And) taught him appropriate language (eloquence)

when the verses are analyzed, it will lead us to at least three important things i.e. 1). allah the almighty is the source of language which is then taught to Prophet Adam as his first creature. 2). Language is only granted to humans, but not to the other creatures. 3). Humans are created by Allah The Almighty from the start with an innate capability to use language. In Islam, it is important to believe that Allah The Almighty is the creator of everything. whatever an individual sees and feels in this world, whether it's the earth, the sky, the sun, the moon, the stars, the living organisms such as animals and plants are the creation of allah the almighty. with regard to language, it is also the creation of Allah The Almighty. In the Holy Quran surah As Saffat verse 96, it is clearly stated:

وَاللَّهُ خَلَقَكُمْ وَمَا تَعْمَلُونَ ﴿٩٦﴾

"And God created you and what you make"

this verse clearly indicates that allah the almighty not only creates humans, but also all humans made things including language that humans use to communicate. It is allah the almighty who has created man and provided him with all things required to make and to do something such as the creation of humans' brain to plan and to formalize language, the creation of humans' speech organs which enable them to articulate languages. The divine source seems to fit with the concept of Language Acquisition Device (LAD) proposed by Noam Chomsky in the 1960s. According to Chomsky (1965), humans are born with an instinct (innate facility) for acquiring languages called LAD by which God implanted in every human being. The LAD allows humans to have the inborn capacity to acquire and to use languages creatively. the divine view (language is god's gift to mankind) is not only believed in Islam, but also in other religions. In Christianity for example, the Bible affirms that God gave Adam the ability to speak and to create new words which enabled him to name all things (Genesis. 2:19-20). In addition, fromkin, V., rodman, r., & Hyams, n. (2003) are of the opinion that similar beliefs are also found in Egyptians (The God Thoth was the creator of speech), Babylonians (The God Nabu was the giver of language), and Hindus (The female god, sarasvaty: Brahma's wife, was the giver of humans' language ability). With regard to this theory, Trask, L. (2014) states that the *Divine origin* is a theory formed on the basis of incomplete information that human language originated as a gift from god. therefore, no scholar takes the idea seriously today. However, those who believe in religions would always accept and never deny that god the almighty gave to man the faculty of language which differentiates him from the other living creatures. then, this acceptance can be taken in literal sense as recognition of the human origin of the language based on the theory of divine origin.

2.2. The Theory of Evolutionary Development

This theory believes that a language is a result of gradual change in human communication system over time from gestures to complex speech. In other words, is that the languages of the world evolved spontaneously and they are not given and designed by anything. Those who hold this theory to believe the origin of language are called evolutionists. one of the evolutionists, Corballis, M. C. (2002), is of the opinion that language, as a communication

system of humans, developed gradually, starting from gestures used by apes and then mixed with vocal communication used by the larger-brained genus *Homo* about two million years ago. This mixture has consequently caused the emergence and development of syntax which finally form an autonomous vocal language used by humans to communicate. From the statement, we can learn three things concerning language origin from this theory perspective namely:

- a. Language evolved from hominids' mimetic skill that is the ability to use the whole body as a representational device for communications.
- b. Language also evolved from hominids' vocalic skill that is the ability to use voice for expressing themselves.
- c. The mixture between mimetic and vocalic skill emerged the syntax of language which in the end developed as languages.

In response to this theory, Harrub, B., Thompson, B., & Miller, D. (2003) comment that the theory is simply the speculation of the evolutionists about the origin of language because scientific evidence to support this theory remains mysteriously unavailable until today. Another evolutionist, for example, Zimmer, c. (2011) states that no one exactly knows the chronology of this evolution, because language leaves precious few traces on the human skeleton. The voice box is a flimsy piece of cartilage that rots away. It is suspended from a slender C-shaped bone called a hyoid, but the ravages of time usually destroy the hyoid too. Therefore, the theory of evolutionary development is regarded inconclusive. The debate about it is still unsettled and continues up to the present (Fromkin, V., Rodman, R., & Hyams, N. 2003).

2.3. The Theory of Language as a Human Invention

Another different theory of the origin of language is the theory of language as human invention. According to Taylor, T. J. (1997), the most influential expert of this theory is Condillac (1947). Condillac believed that only humans have language. The possession of language gives humans a special characteristic which makes them different from animals. Language indicates the ability of humans to control the operations of their mind. An animal also has mind, but it is a pre-linguistic operation. It means that an animal can perform basic operations of the mind such as perceives, compares, reflects, judges, and so on, but those acts are not operated consciously

or voluntarily; the acts are simply reflex responses to physiological or circumstantial stimuli. In other words, animals have pre-linguistic mind which is 'automatically' operated. On the other hand, humans have linguistic mind which is 'manually' operated. Yet Condillac does not mean to say that there are no pre-linguistic humans, before they had language, they used gestures or voices which were performed manually and intentionally from the access of their mind operations. The communication devices were not reflex machines. In this regard, Condillac (1947) is of the opinion that language is humans' invention because they have mind and will. Condillac (1947) says that humans' mind has 'artificial' characteristics which means that mind is like a tool which is used to make language. Therefore, gestures, sounds, numbers, and letters are only instruments used to form what we call language. In addition, humans' will has 'foreign' characteristics which means that will is a natural ability to hear, see, think, move, etc. So, the cooperation between mind and will has invented an 'autonomous' communication device, that is, what we would today call 'language'.

3. Language and Linguistics

referring to the definition of language provided earlier, language is considered as a system of communication used by humans only to communicate messages, in which the communication system is built by conventionalized elements such as sounds, words, phrases, sentences, and meanings. So, we may say that language as a system has at least five basic elements namely; sounds, words, phrases, sentences, as well as meaning. These five elements are the entities we learn when learning or studying a language. Besides, they are important knowledge that we need to have in order to be able to use the language for communication. So, if we learn a language, for instance, we must learn:

- a. the sounds of the language in order to be able to pronounce the sounds of that language properly,
- b. the words of the language and make effort to memorize all the words of the language.
- c. the structures of the language to know how to put the memorized words together into phrases or sentences according to the patterns used in the particular language.

- d. the meaning in the language in terms of either, meaning in the language components e.g. words and sentences or meaning in the language usage e.g. speech acts (particular functions of speech such as how to thank, how to greet, how to complaint etc.).

the process of learning a language required learners learning the all types of the language knowledge which enable them to communicate with each other, to express ideas, perceptions, emotions, desires, in the form of spoken and written discourses. In other words, the types of language knowledge that the learners learn in the language are all important micro skills (e.g. pronunciation, vocabulary, and grammar) which are required to build the macro skills of the language such as speaking, listening, reading and writing. These two types of skills have made language to be the most perfect means of communication possessed by human beings which distinguish it from animals' communication system. Although in some societies, we frequently find fables, legends or *animated films* produced or released by *The Walt Disney* where we are told that animals communicate using languages like humans, not only among themselves but also with humans. But those are all fictions (stories that are not true) which cannot provide evidence that animals do speak and have language.

On the other hand, if we want to learn about the language elements, for example, we want to know how the words are produced, structured, acquired, perceived, as well as change over time. So, we need Linguists as the scientific study of languages which means that the subject matter of linguistics is language. The branches of linguistics are established based on the elements of languages. The following figure illustrates the relationship between language and linguistics.

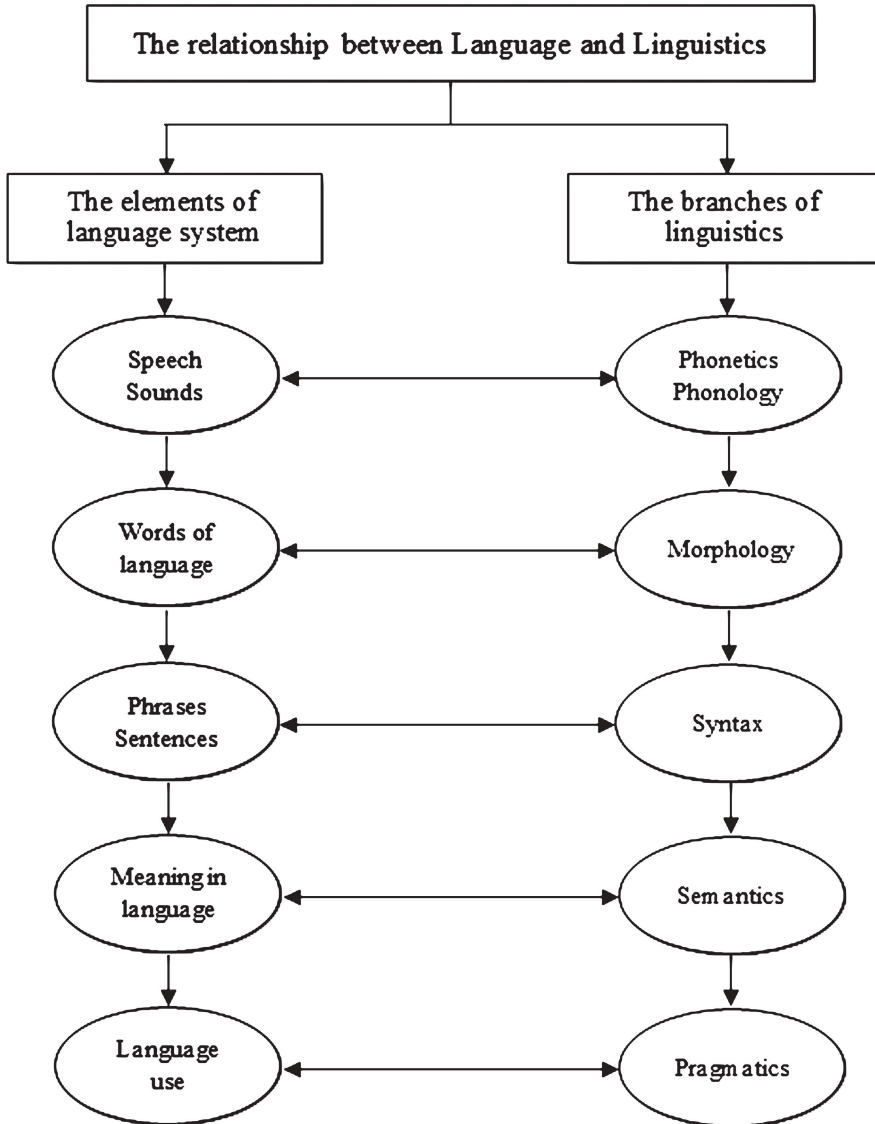

Figure 10
Reciprocal relationship between language and linguistics

By looking at figure 10, we could then understand that linguistics is a scientific study that is built on languages. Hence, it stands to reason for saying that language is the fundamental unit of the branches of linguistics. Without languages, there will be no subject of linguistics. Languages make way for the growth of the field of linguistics and its branches. Traditionally, linguistics studies a language as humans' communication system consisting of five main

subfields, known as ‘the branches of pure linguistics’ namely:

- a. **Phonetics**, it studies human speech sounds in their physical aspects (e.g. where the sounds are produced-place of articulation, how the sounds are produced-manner of articulations, etc.).
Phonology, it studies how the speech sounds in their cognitive aspects (e.g. how the speech sounds are organized, perceived, and used in a language).
- b. **Morphology**, it studies words in human language (e.g. parts of words, how words are formed in a language).
- c. **Syntax**, it studies the rules of putting words together to form sentences in a certain language.
- d. **Semantics**, it studies the meaning and the interpretation of words and sentences in a language.
- e. **Pragmatics**, it studies the use of language such as words and sentences in social context.

In addition to pure linguistics, there are two other types of linguistics i.e. interdisciplinary linguistics and applied linguistics. Interdisciplinary linguistics is the results of combining two academic disciplines into one subject of study e.g. Psycholinguistics. Psycholinguistics is a kind of interdisciplinary linguistics emerged after combining linguistics with Psychology. It investigates the relationship between language and the mind. Psycholinguistics is interested in how the mind acquires, produces, as well as perceives language. Furthermore, applied linguistics is a field of study that uses linguistic theory to identify, investigate and solve language-related problems. For example, an English teacher designs instructional materials for teaching a foreign language to university students.

CHAPTER THREE

UNDERSTANDING PHONETICS

I learned by watching my favorite shows. I would just rewind and say the words back, until they sounded right to me. I never studied the American accent, in terms of getting a teacher or taking phonetics classes. I've always been a good mimic. It really wasn't that hard for me.

(Adelaide Kane)

In this section, some essential things concerning phonetics are proposed for discussion i.e. The definition of Phonetics, Human speech sounds from phonetics perspective, as well as Phonetics for teaching pronunciation of English sounds. Those things are sequentially presented as follows.

1. The Word 'Phonetics' Defined.

To begin the discussion of phonetics, we should clearly know what phonetics is. The clear understanding of phonetics will be enriched by presenting definitions derived from a variety of online sources on the internet and from the linguists. From the online sources, a number of definitions of phonetics are found such as:

- a. <http://www.dictionary.com> defines phonetics as “the science or study of speech sounds and their production, transmission, and reception, and their analysis, classification, and transcription”.
- b. <http://www.yourdictionary.com> points out that “phonetics is the study of the sounds of human speech using the mouth, throat, nasal and sinus cavities, and lungs”.

- c. <https://en.oxforddictionaries.com> gives simple definition of phonetics that “it is the study and classification of speech sounds”.
- d. Another definition is put forward by <http://www.baap.ac.uk> that “phonetics is the systematic study of speech and the sounds of language”.
- e. <http://dictionary.cambridge.org> also proposes that “phonetics is the study of the sounds made by the human voice in speech”.
- f. Besides, <http://www.chegg.com> also defines “phonetics as the study of sound in speech that focuses on how speech is physically created and received, including study of the human vocal and auditory tracts, acoustics, and neurology”.
- g. In addition, <http://www.phon.ox.ac.uk> puts forward the definition of phonetics that “it is a study that deals with the production of speech sounds by humans, often without prior knowledge of the language being spoken”.
- h. finally, <https://en.wikibooks.org> defines “phonetics as the systematic study of the human ability to make and hear sounds which use the vocal organs of speech, especially for producing oral language. It is usually divided into the three branches of (1) articulatory, (2) acoustic and (3) auditory phonetics”.

In addition to the definitions from the online sources, some clear definitions of phonetics have been offered by prominent linguists, for example;

- a. Ladefoged, P (1975) states that “phonetics is concerned with the speech sound that occur in languages of the world. It makes effort to know what the sounds are, how they fall into patterns, and how they change in different circumstances”.
- b. Catford (1992) defines “phonetics as the study of the physiological, aerodynamic, and acoustic characteristics of speech-sounds”.
- c. Fromkin, V., Rodman, R., & Hyams, N. (2003) point out that “phonetics is the study of speech sounds, utilized by all human languages to represent meanings”.
- d. Becker, A., and Bieswanger, M. (2004) are of the opinion that “phonetics is concerned with the wide variety of sounds used by speakers of human languages”.

- e. O’Grady et.al. (2005) define “phonetics as a branch of linguistics that comprises the study of the sounds of human speech, or in the case of sign languages the equivalent aspects of sign”.
- f. Next, Roach, P. (2009) claims that “phonetics is the scientific study of speech which concerns in the discovery of how speech sounds are produced, how they are used in spoken language, how we can record speech sounds with written symbols and how we hear and recognize different sounds”.
- g. Besides, Lanpher (2011) asserts that “phonetics is the study of speech sound in any language which has three branches namely Articulatory, acoustics and auditory Phonetics. articulatory phonetics deals with how sounds are articulated where mouth, tongue and lungs are parts of the system. auditory phonetics deals with how it sounds when articulated. Acoustic phonetics is about how the sounds are perceived in our brain”. The last but not the least,
- h. nordquist, R. (2016) is of the opinion that “phonetics is the branch of linguistics that deals with the sounds of speech and their production, combination, description, and representation by written symbols”.

After reading all of the definitions above, we can then identify three mutually shared underlying concepts of phonetics from the definitions namely: speech organs, speech sounds, and speech sounds productions. the three concepts may be used for providing another definition of phonetics that it is a scientific study which deals with humans’ organs of speech, speech sounds, as well speech productions. The basic components of phonetics are discussed as follows.

a. Speech organs (articulators)

When speaking, people use speech sounds produced by flowing air from the lung to the mouth for communicating messages. to vary the speech sounds’ quality, they need articulation that is the action of producing sounds using their speech organs (articulators). articulators refer to any organs of speech that takes part in the production of human speech sounds. they include the lips, teeth, alveolar ridge, hard palate, velum (soft palate), glottis and various parts of the tongue (e.g. tip, middle, and back part). In this regard, articulators can be seen in figure 11 in the

form of a diagram of a human head. The learners are in need of learning it carefully to get a picture of the articulators' shapes that are used to make speech sounds in their mouth.

Figure 11

Articulators to produce speech sounds

Source: <https://www.pinterest.com/pin/514254851179328077/>

b. Speech sounds

Speech sounds may be understood as a set of distinctive sounds produced when people speak in a particular language. so, a speech sound is plainly a sound uttered by speakers of a language. For example the word 'book', this word seems to have three different sounds i.e. /b/, /ʊ/, and /k/ in which /b/ is the representative of letter 'b', /ʊ/ is the representative of letter 'oo' and /k/ is the representative of letter 'k'. therefore, it must be fully understood that speech sounds are not the letters used to spell the words. They are all about what you are hearing, not what letters to use to spell the words. In other words, english speech sounds are not

representative of the English alphabets. The problem now is how would somebody transcribe and distinguish between the sounds they are hearing in communications? the answer is this, since sounds are different from the letters, a new and different set of symbols is needed to represent the speech sounds. Since 1888, an effort has been made to create a universal system for transcribing speech sounds to help the linguists, language teachers, even learners transcribing languages consistently and accurately. this system is famously known as the International Phonetic Alphabet (IPA). The IPA not only transcribes speech sounds, but also provides symbols to represent sounds of every language in the world.

c. The production of speech sounds

The production of speech sounds indicates the process of making speech sounds by using articulators which is initiated from flowing the air provided by the lung, the air then goes through the glottis in the larynx that then is modified by the vocal tract (oral cavity) or vocal apparatus (nasal cavity) into different qualities of sounds i.e. consonants and vowels. Consonant sounds are made by blocking the airflow completely or partially during the speech. The production of consonant sounds is mainly determined by two factors i.e. the place where the sounds are produced (place of articulation) and the manner how they are articulated (manner of articulation). For example, when someone wants to make a *p* sound, he needs to move his two lips come together tightly and then blocks the air flow for a moment. After that, he has to release the air pressure suddenly in the mouth which causes plosive sound. The place of articulation of this sound is therefore called *bilabial*, and the manner is called *stop* (also known as a *plosive*). On the other hand, vowel sounds are made in a different way from consonants. Vowel sounds don't need airflow obstruction, but need a more continual airflow. In this regard, phoneticians describe that the production of different vowel sounds is affected by HAR which stands for Height, Advancement, and Rounding. Height refers to the height of the jaw whether its position is open, mid, or near close. Advancement refers to the frontness or the backness of the tongue (how front or back the tongue is). Rounding refers to the shape of the lips whether the lips are rounded or unrounded. For example, when

the jaw is near close, it will produce sound /i/ as in 'he', sound /I/ as in 'with', sound /ʊ/ as in 'would' etc.

furthermore, Phonetics, as the study of speech sounds of spoken languages, makes effort to describe two important things concerning speech sounds i.e. and what physical properties of the sounds exist in spoken languages (acoustic phonetics) and how sounds are produced (it is also called articulatory phonetics). By using acoustic approach, phonetics tells us that a language mainly consists of two kinds of sounds i.e. segmental and supra-segmental sounds. segmental sounds refer to the smallest units of a sequence of sounds i.e. consonant and vowel sounds. on the other hand, supra-segmental sounds refer to aspects of pronunciation that go beyond the production of individual (segmental) sounds, for example: stress and intonation (c rane, l . B., Yeager, e ., & w hitman, r . l . 1981).

2. The Production of Segmental Sounds

2.1. English Consonant sounds

This discussion of this section is focused on describing three kinds of information related to the production of the first segmental sound that is English consonant sounds namely; describing which parts of the mouth are used for making a particular consonant sound of english (place of articulation), describing how the consonant sound is produced (manner articulation), and describing whether or not the vocal chords vibrate (distinctive feature). These kinds of information are important for learners of English to help them be able to produce consonant sounds of english naturally.

2.1.1. Place of Articulation

Place of articulation may be understood as the specific location in the mouth in which two speech organs work together in producing a consonant sound. for example, the tongue and the teeth come together in forming a dental sound. there are six speech organs used to utter consonant sounds i.e. the lips, the teeth, the alveolar ridge, the hard palate, and the soft palate or velum and four parts of the tongue (i.e. the tip, the blade, the body, and the root). In terms of place of articulation, consonant sounds in a merican english can be classified into nine sounds which could easily be remembered by using the following acronyms: BIl a daP at Pa Veglola

No	Acronyms	Consonant sounds
1	BI	Bilabial
2	la	Labiodental
3	d	dental
4	a	alveolar
5	Pa	Palatal
6	Pa	Palato alveolar
7	Ve	Velar
8	glo	glottal
9	la	Labiovelar

a. Bilabial sounds: [p], [b], [m]

These consonant sounds are produced by putting two lips together as in sound [b] in the word ‘buy’ (baɪ), [p] in the word ‘pay’, (peɪ), and [m] in the word ‘my’ (maɪ).

b. Labiodental sounds: [f] and [v]

These consonant sounds are produced by contacting the lower lip and upper teeth as in sound [f] in the word ‘five’ (faɪv), ‘’, and [v] in the word ‘villa’ (vɪlə).

c. Dental sounds: [θ] or [ð]

These consonant sounds are made when tongue tip for sound [θ] or tongue blade (part just behind the tip) for sound [ð] contacts upper teeth, as in the two *th* sounds e.g. sound [θ] as in the word ‘Thursday’ (θɜrzdeɪ) and sound [ð] as in the word ‘this’ (ðɪs).

d. Alveolar sounds: [t], [d], [n], [l], [s], [z]

These consonant sounds are made when the tongue tip contacts the alveolar ridge (the gums just behind the teeth), as sound [t] in the word ‘tie’ (taɪ), sound [d] in the word ‘die’ (daɪ), sound [n] as in the word ‘night’ (naɪt), or sound [l] as in the word ‘lie’ (laɪ); or tongue blade contacts the alveolar ridge, as sound [s] as in the word ‘sight’ (saɪt) or sound [z] as in the word ‘zeal’ (zil).

e. Palatal sounds: [dʒ], [tʃ], [j]

These sounds are produced when the blade of the tongue (Middle of tongue) touches the hard palate e.g. sound [dʒ] as in the word ‘judge’ (dʒʌdʒ), sound [tʃ] as in the word ‘chew’ (tʃu), and sound [j] as in the word ‘young’ (jʌŋ).

f. Palato Alveolar sounds: [ʃ], [ʒ], [r]

These sounds are articulated when the tip the blade of the tongue approaches or touches the alveolar ridge and the main body of the tongue approaches the hard palate in the mouth e.g. sound [ʃ] as in the word ‘ship’ (ʃɪp) in which the tip of the tongue is used, sound [ʒ] as in the word ‘casual’ (ˈkæʒəwəl) in which the blade of the tongue is used, and sound [r] as in the word ‘remember’ (rɪˈmembər) in which the tip of the tongue approaches (never touches) the area in the mouth between alveolar ridge and hard palate. The sounds are called palato alveolar because the production of the sounds involves two place of articulations i.e. the alveolar ridge as the primary articulation and palatal as the secondary articulation.

g. Velar sounds: [k], [g], [ŋ]

These consonant sounds are produced when the back of the tongue touches the soft palate (the velum) as sound [k] in the word ‘cup’ (kʌp), sound [g] as in the word ‘gap’ (gæp), and sound [ŋ] as in the word ‘sing’ (sɪŋ).

i. Glottal sound: [h]

This consonant sound is produced when the flow of air is stopped by the *glottis* with some constriction of the glottis closing, and then released e.g. sound [h] as in the word ‘how’ (haʊ) and ‘who’ (hu).

j. Labio-Velar sound: [w]

This consonant sound is produced when the back part of tongue contacts the soft palate and lips also come close to each other. e.g. sound [w] as in the word ‘what’ (wʌt).

2.1.2. Manner of Articulation

Manner of articulation describes two things i.e. *The first*, how the different organs of speech interact one another in producing consonant sounds. *The second*, how the airflow is obstructed to affect the production of

consonant sounds' quality. Thus, the manner of articulation is a determinant which presents distinctive feature of consonant sounds in the English language because it is possible to make several different consonant sounds at the same place of articulation. Therefore, manner of articulation gives basic distinctions of how consonant sounds are made through seven concepts of manner of articulation i.e. stops, fricatives, affricatives, nasals, lateral, and Approximant. The six manners of articulations are easily remembered by the following *acronyms*: *STOFANASLA*

No	Acronyms	Manner of Articulations
1	sto	stop
2	f	fricative
3	a	affricative
4	nas	nasal
5	l	lateral
6	a	approximant

a. Stops or Plosives

In this manner of articulation, consonant sounds are produced by closing the speech organs both oral and nasal cavity that the airstream is blocked. It results air pressure in the oral cavity. when the air pressure is suddenly released, aspiration will then occur. the English consonant sounds produced through this manner of articulation are [p] as in the word 'pen', [t] as in the word 'tie', [k] as in the word 'key' and [b] as in the word 'buy', [d] as in the word 'die', [g] as in the word 'go'.

b. Fricatives

This type of manner of articulation produces consonant sounds by blocking the airstream in the mouth, but not making complete closure (a complete closure belongs to a stop) that the air moves through the mouth and produces audible friction e.g. [s] as in the word 'cycle', [z] as in the word 'zoom', [f] as in the word 'fan', [v] as in the word 'vast', [θ] as in the word 'method', [ð] as in the word 'then', [ʃ] as in the word 'ship', [ʒ] as in the word 'pleasure' and [h] as in the word 'hot'.

c. Affricatives

This manner of articulation produces consonant sounds by blocking the airstream briefly with the tongue in the mouth, but in contrast to stop, the blocked airstream is suddenly not released, but is slowly released and causes audible friction e.g. sound [tʃ] as in the word ‘check’ and [dʒ] as in the word ‘jump’.

d. Nasals

This manner of articulation produces consonant sounds by blocking the airstream pass through the oral cavity using the velum (soft palate) and the back of the tongue, so that the air can only pass through the nasal cavity e.g. sounds [m] as in the word ‘man’, [n] as in the word ‘night’ and [ŋ] as in the word ‘sing’.

e. Laterals (Liquid)

This manner of articulation produces consonant sound by contacting the tip of the tongue onto the alveolar ridge so that the air passes through both sides of the tongue e.g. sounds [l] as in the word ‘leap’.

f. Approximants (Glides)

This type of manner of articulation deals with the way consonant sounds are uttered by making the articulators interact e.g. the tongue and the alveolar ridge without actually touching. In English, there are three approximants i.e. sound [j] as in the word ‘you’, sound [w] as in the word ‘world’ and sound [r] as in the word ‘rise’.

2.1.3. The distinctive features of the English consonant sounds

One of definitions of distinctive feature is available on <http://www.yourdictionary.com> in which distinctive feature is defined as something unique or different that sets someone or something apart from the rest. In English, some different consonant sounds are produced in the same place and manner of articulation e.g. sound [p] and [b]. These sounds are both identified as bilabial and stop sounds. To help the learners in distinguishing both sounds, distinctive feature is then used that is to identify the sounds’ distinction by knowing whether the vocal chords vibrate when the consonant sounds are made (voiced), or whether the vocal chords do not vibrate when the consonant sounds are uttered (voiceless). To test the voicing quality of the consonant sounds, the learners may place their fingers on the voice box (i.e. the location

of the adam’s apple in the upper throat). this is done to know whether the vocal cords vibrate or not when a particular consonant sound is made. For example, in distinguishing sound [p] and [b], the learners produce sound [p] while placing their fingers over the voice box, they should not feel the vibration. Therefore, sound [p] is known as a voiceless sound in terms of its distinctive feature to sound [b]. On the other hand, in sound [b], the learners feel the vibration. Therefore, sound [b] is then called as a voiced sound. In a nut shell, sound [p] is phonetically called as a voiceless bilabial stop and sound [b] is a voiced bilabial stop.

Having presented the discussion of the types of english consonant sounds based on place of articulation, manner of articulation, and distinctive features, it is then very important to present the summary of the discussion in the form of chart.

Place of articulations									
	Bilabial	Labio-dental	dental	alveolar	Palatal	Palato alveolar	Velar	glottal	Labio Velar
Stop	p b			t d			k g		
fricative		f v	θ ð	s z		ʃ ʒ		h	
affricative					tʃ dʒ				
Nasal	m		n				ŋ		
l ateral				l					
approxi - mant					j	r			w

Voiceless phonemes are bold. Voiced phonemes are normal

2.2. The Production of Vowel Sounds

Vowel sound is the second segmental sound discussed in this section. to produce vowel sounds, native speakers of english also use the place of articulation and the manner of articulation of vowel sounds. the place of articulation here refers to what speech organs are required to produce vowel sounds which only consist of the mouth, the tongue, and the lips. on the other hand, manner of articulation here refers to how the speech organs are functioned to produced vowel sounds in terms of height, frontness, as well as rounding. w illiamson, g (2015) is of the opinion that the production of vowel sounds in English (Both American and British) involves five main parameters namely: openness of the mouth, tongue elevation, position of

tongue elevation, lips' shapes, and length of vocalization. The first four of the parameters affect the size and shape of the oral cavity which alter the types of vowel sounds (vowel quality) produced in the oral cavity. the last one that is length of vocalization influences the duration of production.

a. Openness of the mouth

as stated earlier that mouth is one of speech organs which functions to alter the quality of vowels. according to Williamson, G (2015), the quality of vowel sounds can be different from one another according to the extent to which the jaws are either **open** or **close** (not 'closed', as a complete closure would prevent the free flow of air out of the mouth). for example, as a native speaker of English says the word 'palm'. the speaker will produce a vowel sound /ɑ/. If we notice how the native speaker produces the vowel sound, we will then obviously see that the speaker's jaws are wide apart and this is what Williamson, G (2015) calls as a relatively open mouth posture in which an open mouth posture will produce open vowel sounds. therefore, he suggests that we can see and even feel ourselves the relative openness or closeness of our mouths by alternating the production of these vowels in quick succession (/i/ – /ɑ/ – /i/ – /ɑ/ – /i/ – /ɑ/) as you observe ourselves in a mirror.

b. Tongue elevation

The tongue also plays a decisive role in influencing the quality of vowel sounds by altering its positions in the mouth. In phonetics, the position of the tongue in the mouth can be described in three horizontal positions i.e. **high, mid, and low**. for instance, when the tongue is placed in a high position, it will produce the vowel sound /i/ as in the word 'bee', which is also known as a close vowel in the perspective of mouth's openness. In contrast, when the tongue moves downward to a low position, it will produce different vowel sounds e.g. vowel sound /æ/ as in the word 'trap'. Besides, different vowel sounds will be produced as the tongue is placed about halfway between high and low that is a mid-position like the sound /ɛ/ as in the word 'dress'. In a nutshell, native English speakers correlate between tongue elevation and openness of the mouth when articulating vowel sounds in which close vowels (with the mouth relatively closed) are articulated with a relatively high tongue elevation and open vowels are typically articulated with a relatively low tongue position.

c. Position of tongue elevation

When discussing the ‘position of tongue elevation’, it will refer to where this elevation takes place on the three horizontal positions i.e. front, central, and back. Taking vowel /i/ again as an example, we have known that this sound is both close and high vowel. However, if we notice the position on the tongue horizontally, we will find out that this sound is articulated by positioning the front of the tongue in the direction of the hard palate. Therefore, this sound is also called as a front vowel. In addition, using the vowel /a/, in the word ‘palm’ also as an example, we can feel that this time the sound is produced by raising the back of the tongue in the direction of the soft palate. Therefore, it is called as a back vowel sound.

d. Lips’ shapes

In making the sounds of English vowels, native English speakers usually use two types of lip shapes i.e. rounded and unrounded. As a rounded vowel is made, a speaker’s lips form an opening and circular mouth and unrounded vowels are made with the lips in relaxed position. In most languages, front vowels tend to be unrounded, and back vowels tend to be rounded (<https://en.wikipedia.org>). To see and to feel the difference between them, we can say the word ‘lose’ which makes vowel sound /u/ and alternate it by saying the word ‘knee’ which produces vowel sound /i/. When doing this, we will see that our lips are rounded for the production of vowel sound /u/, but they will be unrounded (spread) when producing vowel sound /i/.

e. Duration of vocalization

The last important parameter of vowel sound production is length of vocalization which means that, native English speakers relatively produce longer and shorter vowel sounds due to the intervals of time when producing the vowel sounds. These types of vowel sounds are categorized as long and short. For example, as a native English speaker says the word ‘goose’, the speaker will make sound /u/ which is relatively heard longer than when the native speaker says the word ‘trap’ which produces sound /æ/ and is relatively heard shorter. In addition to the above explanation, it is important to clarify here that the terms ‘long vowel’ and ‘short vowel’ do not indicate the length of the vowel, but rather the sound of the vowel.

In linguistic contexts, the terms ‘long’ and ‘short’ are referred to as ‘tense’ and ‘lax’ vowels, respectively. these two terms are used to indicate the distinctive feature of vowel sound. according to williamson (2015), it is sometimes important to make clear that a particular vowel is a tense (long) vowel; a colon-like mark (:) is placed after the symbol for the vowel, e.g. /i:/, /u:/, /ɑ:/. For example, as a native English speaker says the word ‘beat’, the speaker will make a tense vowel /i:/ which is the counterpart to the lax /ɪ/ as the native English speaker says the word ‘bit’. Another example is the production of sound /u:/ known as a tense vowel as in the word ‘kook’ which is the counterpart to the lax /ʊ/ as in the word ‘cook’.

2.2.1. Vowel Sounds in English

after knowing how the vowel sounds are produced in english, it is then important to recognize the categories of english vowel sounds. williamson (2015) categories english vowel sounds into two categories i.e. simple vowel which is also known as pure vowel or **monophthongs** and complex vowel which is also known as **diphthongs**.

a. Simple Vowel Sounds

simple vowel is made when a speaker produces a single vowel configuration without moving the tongue, the lips, and the mouth, in other words the speech organs are in a relatively unchanging position. for example:

/ɪ/	:	it, ink, sink, ill	/ɪt, ɪŋk, sɪŋk, ɪl/
/i:/	:	seat, east, eagle	/si:t, i:st, 'i:gl/
/ɛ/	:	get, set, red, bell	/gɛt, sɛt, rɛd, bɛl/
/æ/	:	cat, rat, bat, mat	/kæt, ræt, bæt, mæt/
/ɑ:/	:	arm, ask, calm, car	/ɑ:m, ɑ:sk, kɑ:m, kɑ:/
/ʌ/	:	cup, shut, cut	/kʌp, ʃʌt, kʌt/
/ə/	:	about, ago, along	/ə'baʊt, ə'gəʊ, ə'lɒŋ/
/ɜ:/	:	pearl, earn, girl	/pɜ:l, ɜ:n, gɜ:l/
/ʊ/	:	Cook, book, look	/kʊk, bʊk, lʊk/
/u:/	:	Spoon, food, fool	/spu:n, fu:d, fu:l/
/ɑ/	:	pot, lot, lock	/pɑt, lɑt, lɑk/
/ɔ:/	:	Call, all, brought	/kɔ:l, ɔ:l, brɔ:t/

The following figure presents the overall simple vowel sounds used in both American and British English. The vowel sounds are presented based on the vowel sounds' place of articulation (i.e. the tongue elevation, the tongue position) and manner articulation (i.e. the duration of vocalization). This figure exclusively shows the two vowels in black and in red. If the sound stands alone in black, it means that the vowel occurs in both American English (AE) and British English (BE). On the other hand, if a vowel sound is written in black and in red, it means that the black is for AE and the red is for BE.

 Articulators to produce speech sounds
 The overall simple vowel sounds in American and British English
 Source: Williamson (2015)

b. Complex vowel sounds

A complex vowel sound is formed by the combination of two vowels in a single syllable, in which the sound begins as one vowel and changes to another vowel sound in the same syllable. In producing such a vowel sound, a speaker's mouth shape usually changes. this is because the speaker has to make two types of month movements i.e. starting movement to produce simple sound at the beginning and ending movement to combine the simple vowel sound with another to produce a vowel sound combination in the same syllable at the end. For example:

/ɪə/ :	hear, cheer, deer	/hɪə, tʃɪə, dɪə/
/eə/ :	chair, their, air	/tʃeə, ðeə, eə/
/ʊə/ :	tour, sure, poor	/tʊə, ʃʊə, pʊə/
/eɪ/ :	pray, say, day	/preɪ, seɪ, deɪ/
/aɪ/ :	fight, eye, pie	/faɪt, aɪ, paɪ/
/ɔɪ/ :	voice, boy, oil	/vɔɪs, bɔɪ, ɔɪl/
/əʊ/ :	Slow, go, so	/sləʊ, gəʊ, səʊ/
/aʊ/ :	out, found, count	/aʊt, faʊnd, kaʊnt/

3. The Production of Supra-segmental sounds

3.1. Word stress

word stress is a certain emphasis given to a unit of pronunciation (syllable) in individual words not in phrases or sentences. As an individual item of a phrase or a sentence, each word has its own stress which is put on a syllable of the word. In English, short words usually have one stress e.g. in the word ‘sample’, it has two syllables i.e. sam·ple. the stress is placed in the first syllable [ˈsam·pəl], and longer words usually have two stresses i.e. primary stress [ˈ] and secondary stress [-] but the secondary stress is always a much smaller stress e.g. in the word ‘democracy’, it has four syllables i.e. de·moc·ra·cy. The primary stress is put on the syllable [ˈma] and the secondary stress is placed in the last syllable [sē] that the word ‘democracy is pronounced [di-ˈma-krə-sē]. As an important note about placing stress that there are many two-syllable words in English which may be articulated in two different ways in which the stress place changes the part of speech of the word. for example:

- Present = (noun) pres·ent \ ˈpre-zənt \ a gift.
- Present = (verb) pre·sent \ pri-ˈzent \ to give something to someone.

Therefore, it is important that we stress the right syllables, so people can adequately understand our words. we can use a dictionary to check the word stress of new words before using them.

In most literature of phonetics acoustic on english, it is generally recognized that there are at least three level of stress i.e. primary stress, secondary stress, as well as unstressed which are indicated by the following marks:

(2018). However, it is important to remember that there are many exceptions to every rule. so, do not rely on them too much. the positive side of these rules is that it provides a good framework for understanding that there are some general patterns to syllable stress in multi-syllabic english words (kopecky .a, 2010). In addition, it is suggested to use a dictionary to check the word stress of new words in addition to knowing the rules.

3.2. Intonation

all languages in the world have their own intonation, including english. according to Becker, a., & Bieswanger, m. (2004), intonation, in english, helps to mark the functions and the boundaries of a syntactic unit e.g. whether a sentence functions to ask or to inform etc. for instance, a statement like ‘she is sleeping’ is marked as giving information when it is ended by a falling pattern of sound (pattern of sound = pitch), but is marked as a yes/no question when it is finalized by a rising pitch. Besides, intonation is also used to emphasize new information in an utterance which mainly functions to express emotions or attitudes. therefore, Intonation is found different not only within different languages, but also within the same language e.g. english. It is widely known that english has dialectal and regional differences in intonation; for example, there are quite a few differences between British, american as well as general english in terms of their intonation due to a number of aspects. Many factors affect intonation e.g. the speakers’ voice level (low or high), speech rate of delivery (fast or slowly), emotions (feeling sad or happy), attitude (positive or negative), and gender (man or woman). In comparison to word stress which is generally focused on where to place the stress properly in english words when speaking, intonation is more about how speakers should say utterances by rising, falling or remaining their voice flat when speaking. The speakers’ tendency to rise, to fall, or to remain flat their voice really depends on the meaning or feeling they want to express. How they produce their voice commonly indicate the mood of the speakers such as anger, surprise, interest, gratitude, boredom, disappointment etc.

many linguists have analyzed english intonation and eventually distinguish at least four relative pitch levels i.e. low pitch /1/, flat pitch /2/, high pitch /3/, and extra high /4/. three pitch levels i.e. low /1/, normal /2/, and high pitch /3/ are commonly used in normal speeches which may convey

different functions e.g. making statements, addressing questions, etc. on the other hand, the other last level i.e. extra high pitch /4/ is commonly used for screaming or shouting which may convey other different functions such as expressing terrible fear, great happiness, rising anger etc. This section is only focused on discussing the pitch levels in normal speech since these are the most frequent patterns found in utterances of normal social interactions. To show how native English speakers used the pitch levels, linguists record the speakers' utterances and use numbers (intonation contour) to indicate the patterns of intonation. The linguists then establish intonation patterns for normal speeches i.e. falling /2 + 3 + 1/, rising /2 + 3 + 3/, and combining patterns /2 + 3 + 2 + 1/. The overall patterns of intonation can be indicated by arrow symbols i.e. a downward arrow (↓) **is used to indicate falling intonation**, an upward arrow (↑) is used to indicate rising intonation, and a rightward arrow (→) is used to indicate flat intonation.

The identification of the patterns of intonation in English is then used to set general patterns for describing and illustrating how native English speakers generally rise and fall their voice in speech. The description is intended to provide an approximate guide to help the Indonesian learners of English to improve their knowledge of intonation which can be applied in speaking. Nevertheless, it should be noted that in terms of intonation, noticing and practicing it from a 'live' conversation with native English speakers will still be a realistic and preferred option which can never be substantially replaced by a written explanation. Since intonation is emotional and attitudinal that it is best acquired naturally through talking and listening to native speakers of English.

3.3. Juncture

The discussion of this section is focused on the last problem that is recognizing clear-cut borderlines between words in connected speeches which is also known as juncture. In connected speeches, it is essential to know which segment of a phrase (a phoneme) functions to keep utterances apart for the sake of conveying a clear meaning in oral communications with our interlocutors. Often, an utterance, we convey in English, is not clearly understood by our interlocutor simply because we do not know where to pause when we are saying some segments of the utterance. For instance, two

different words i.e. ‘apart’ and ‘a part’. They both are extremely close each other in their spelling, and when we verbally utter the words, they are very indistinguishable due to their similar sounds. However, they both have very different meanings. **Apart** is an adverb, meaning, ‘separately’. Whereas, **A part** is a noun, meaning, ‘a section or division of a whole.’ a good way to say both words differently is to give a brief pause which will separate segment *a* from segment *part* when we intend to say a section or division of a whole. so, the words will sound *a part* to our interlocutor. However, when we intend to say ‘separately’, we simply need to remove the pause. so, the word will sound *apart*. In this regard, Hockett.c.f . (1967) is of the opinion that any difference of sound which functions to keep utterances apart is by definition part of the phonological system of the language’. therefore, a transition from one segmental phoneme to another is called *juncture* and represented by [+] mark. The mark indicates that the speaker is required to a short pause before uttering the next word. according to nicolosi, Harryman & kresheck (2004), juncture is the manner of moving (transition) or mode of relationship between two consecutive sounds. It is the relationship between two successive syllables in speech. In normal conversation, juncture effectively functions as a means to help the interlocutor to distinguish between two identical pairs which have different meanings. for example: ‘see mill’ and ‘seem ill’. t hese words sound identical in phonetic representations. t he listener can only grasp the precise meaning conveyed by the speaker, if the speaker properly uses juncture, for example:

- | |
|---|
| <ul style="list-style-type: none"> - did alex see mill?
dɪd 'æləks si [+] mɪl? - did alex seem [+] ill?
dɪd 'æləks sim ɪl |
|---|

CHAPTER FOUR

UNDERSTANDING PHONOLOGY

*Language can... be compared with a sheet of paper: thought is the front and the sound the back; one cannot cut the front without cutting the back at the same time; likewise in language, one can neither divide sound from thought nor thought from sound; the division could be accomplished only abstractedly, and the result would be either pure psychology or pure phonology.
(Ferdinand de Saussure)*

In chapter two, you have already studied speech sounds in their physical aspects (phonetics) which deal with how humans produce their speech sounds and what speech organs they use to make the speech sounds. It is expected that you are all already familiar with those important things in phonetics. In this chapter, you will learn how to apply the knowledge of the speech sounds (phonetics) in the pronunciation system of a language (phonology).

1. The Word ‘Phonology’ Defined

Just like learning phonetics and the other previous topics, learning phonology needs to be initiated by learning its definitions based on the perspective of two different sources that is from online dictionaries and linguists because understanding its definition will give us a clearer picture of what phonology is. When browsing the internet and searching the definition of phonology from online dictionaries, we find the following definitions.

- a. <https://www.merriam-webster.com> defines “phonology as the science of speech sounds including especially the history and theory of sound changes in a language or in two or more related languages”.

- b. <https://en.oxforddictionaries.com> defines “phonology as the branch of linguistics that deals with systems of sounds (including or excluding phonetics), within a language or between different languages”.
- c. <https://www.dictionary.com> defines “phonology as the study of the distribution and patterning of speech sounds in a language and of the tacit rules governing pronunciation.
- d. according to, <https://www.yourdictionary.com> , phonology is defined as the study of sound patterns and their meanings, both within and across languages”.
- e. according to <https://www.collinsdictionary.com>, “phonology is the study of the sound system of a language or of languages in general”.
- f. <https://www.vocabulary.com> defines “phonology as the study of the way sounds are used in a language and the rules for pronouncing certain words”.
- g. according to <https://www.thefreedictionary.com>, “phonology is the study of speech sounds in language or a language with reference to their distribution and patterning and to tacitrules governing pronunciation”.
- h. <https://www.britannica.com> **defines “phonology** as the study of the sound patterns that occur within languages. some linguists include phonetics, the study of the production and description of speech sounds, within the study of phonology”.

In addition to the definitions provided by the online dictionaries, many linguists also give a variety of definitions on phonology. Definitions that are provided by the linguists are essential to present as well, to enrich the understanding on phonology in addition to those derived from the online sources.

- a. according to crane, I. B., Yeager, e., & whitman, r. I. (1981), “phonology is the study of how speech sounds are organized and how they function in language”.
- b. Lass, R. (1984) defines “phonology as a sub-discipline within linguistics concerned with the sounds of language which is specifically concerned with the function, behavior, and organization of sounds”.
- c. Poole, S. C. (1999) is of the opinion that “phonology studies sounds in the context of languages other speech varieties. It is concerned with which sounds a language uses and how it arranges them. It is concerned with the

contribution of sounds to the task of communication”.

- d. According to Becker, A., & Bieswanger, M. (2004), “phonology is concerned with the speakers’ knowledge of the sound system of one specific language. It is the branch of linguistics that studies the sounds used by a given language, the so-called sound inventory, and investigates the function and (mental) organization of these sounds in the specific language”.
- e. Akmajian, A., et.al. (2017) define “phonology as the subfield of linguistics that studies the structure and systematic patterning of sounds in human language. the term phonology is used in two ways. on the one hand, it refers to a description of the sounds of a particular language and the rules governing the distribution of those sounds”.

When the above definitions are analyzed, we will finally understand that phonology basically studies about the speech sounds from cognitive perspective. In other words, phonology leads us to study about how human’s mind works in two fundamental aspects i.e. to organize and to use the speech sounds in a language.

- a. Phonology studies how speech sounds are organized
when studying phonetics, we study how individual speech sounds are made. An individual sound is regarded as the basic unit of sound which is also named ‘phoneme’. If a phoneme stands alone, it will be meaningless, for example sound /p/, what does it mean? But when it is used together or combined with other different phonemes, it can finally carry meaning. For example, it is combined with a vowel sound /ε/ and a consonant sound /n/, it forms a meaningful sound [pen] which means an instrument used for writing. If we replace the vowel sound /ε/ with a vowel sound /ɪ/, it will become /pɪn/ which carries different meaning that is a thin piece of metal used especially for fastening pieces of cloth. the examples indicate that a phoneme is an individual speech sound that can help speakers to construct meaning. when replacing one sound with another sound, the result is a different word which we can get a new meaning or no meaning at all. from the examples as well, we can learn that each language has a system of forming meaningful sounds in the form of words from combining phonemes. the system is known as ‘the pattern or organization of speech sounds’ which organizes the distribution of speech sounds in order to be

meaningful. In this regard, what linguists believe is that there must be a regular organization that humans use in their mind form to intelligible sounds when speaking. In order to identify the regular organization of humans' speech sound, we must be able to distinct the sounds (phonemes) within the distribution of the organization of particular speech sounds. We can examine the distribution of phonemes as regular organization of speech sounds (pronunciation system) with minimal pairs and allophones, which are explained in the next section of this chapter.

- b. Phonology studies how speech sounds are used as stated earlier that phonology allows us to use our knowledge of phonetics cognitively to make sounds which convey meanings in social interactions. In addition to using possible phonemes to construct a meaningful organization of speech sounds, the question now is what do humans deploy as a means of producing such a meaningful organization of speech sounds?. A possible answer to this question is that the linguists' theoretical statements saying that there is actually specific rule exist in the mind of a speaker (also known as a mental operation) which enables the speaker making the meaningful organization of his/her speech sounds (crane, l. B., Yeager, e., & whitman, r. l . 1981). this theoretical statement reminds me of one of my students' question addressed when I was teaching the subject of introduction to linguistics. His question sounded very simple, but required an answer with a phonological-approach. the question is this, why do native speakers of English pronounce double 'o' letters as phoneme /u/ in the word 'book', but they pronounce the letters differently as phoneme /o / in the word 'floor'? To answer the student's question, I used the theoretical statement by saying that native speakers of English basically use certain rules in their mind when pronouncing english words. the rules govern their way to pronounce the words. The different pronunciation of the double 'o' letters between the words 'book' and 'floor' indicate how the rules work. In terms of pronouncing double 'o' letter in both words, I may explain it by using this rule:

This rule can be read this way: **A is pronounced B under condition C.** so, if we use the rule to explain the answer to the question, the answer is this, double ‘o’ letter is pronounced as phoneme /ɔ/(Mid High Back Rounded Vowel) before letter ‘k’. We may check another possible use of this rule by looking at the other English words that are written by using double ‘o’ letter before letter ‘k’ such as cook, look, and took. According to the rule, the words must be pronounced [kɔk], [lɔk], an [tɔk]. In addition, double ‘o’ letter is pronounced as phoneme /ɔ/ (Mid Back Rounded Vowel) before letter ‘r’. We can also check the validity of this rule by looking at the other English words that are written by using double ‘o’ letter before letter ‘r’ such as door. This word is pronounced [dɔr]. The idea of phonological rules will also be explain in the next section of this chapter.

The aspects seem to be two important basic entities which are mutually shared within the definitions. Hence, the definition of phonology in this book is made by using the two basic aspects, in which phonology may then be defined as a branch of linguistics that focuses on studying the systematic patterns and rules used by humans when producing speech sounds to communicate messages in certain languages. From this definition, we are clearly able to see that phonology carries out at least two basic functions namely; *the first*, to describe how speech sounds are organized to show the existing patterns in the organization of the speech sounds in humans’ mind, and *the second*, to invent rules governing the interaction between the speech sounds.

2. Sounds Patterns: Contrastive and Non-Contrastive Sounds

In this section, we are specifically going to study the patterns of speech sounds’ organization by taking English language as an obvious example. the speech sounds’ organization provides an overview of the patterns of phonemes organization in the language pronunciation system. from this point of view, the phonemes have at least two patterns namely contrastive and non-contrastive sounds. contrastive sound refers to the pattern of phonemes organization in the pronunciation of a word by which if one of the phonemes is switched for another sound, it will produce a new word with different sound and meaning from the previous word. for example, the word ‘say’ is pronounced [seɪ], when phoneme /s/ is switched for phoneme

/d/, it will make a new word 'day' which has different pronunciation [deɪ] and meaning. on the other hand, non-contrastive sound refers to the pattern of speech sounds organization in the pronunciation of a word by which if one phoneme is switched for another phoneme, it will produce different pronunciation, but still the same meaning. For example, the word 'tomorrow' is pronounced [tə'mɑːrəʊ], when phoneme /ə/ is switched for phoneme /u/, it will make different pronunciation [tu'mɑːrəʊ] which doesn't change the word's meaning.

2.1. Contrastive Sounds: Minimal Pairs

the representation of contrastive sound patterns is minimal pair. according to Crane, J. B., Yeager, E., & Whitman, R. L. (1981), the concept of minimal pairs can be understood by three main characteristics namely:

- Contain the same number of segments (letters/alphabets)
- differ in only one segment
- Have different meanings

Based on the three main characteristics, a minimal pair may then be defined as two words which have the same number of phonemes, but differ in one phoneme and meanings. Here is the example; the words 'pin' pronounced [pɪn] and 'sin' pronounced [sɪn] are minimal pairs since the two words have the same number of segments (three segments), differ only in initial segment namely segment /p/ and /s/, and have different meanings, in which the word 'pin' means a thin piece of metal with a sharp point at one end and a round head at the other, used especially for fastening pieces of cloth (<https://en.oxforddictionaries.com>), while the word 'sin' means an action or type of behavior which is believed to break the laws of God (<https://www.collinsdictionary.com>). In this regard, we need to underline that the focus of contrasting a pair of words is the sound of the word (what sounds make up the word) and not the spelling (what letters form the word). Besides, a segment of a minimal pair in this context can be understood as a phoneme in the pronunciation of a word.

minimal pairs are taken place in two different perspectives i.e. the perspective of segmental sounds and the perspective of phonemic position. the perspective of segmental sounds refers to a way of contrasting the pronunciation of two words based on the type of sounds whether consonant or

vowel that we recognize consonant minimal pairs and vowel minimal pairs. The following examples illustrate minimal pairs based on the perspective of segmental sounds:

a. consonant minimal pairs, for example:

- Minimal pairs /b/ and /v/
Berry ['beri] and Very ['veri]
- Minimal pairs /b/ and /p/
Buy [baɪ] and Pie [paɪ]
- Minimal pairs /n/ and /ŋ/
Thin [θɪn] and Thing [θɪŋ]
- minimal pairs /l/ and /r/
Alive [ə'laɪv] and Arrive [ə'rɑɪv]
- Minimal pairs /ʃ/ and /t/
Catch [kæʃ] and Cat [kæt]
- Minimal pairs /s/ and /ʃ/
Sea [si] and She [ʃi]
- minimal pairs /f/ and /v/
Fan [fæn] and Van [væn]
- minimal pairs /f/ and /h/
Fat [fæt] and Hat [hæt]
- Minimal pairs /f/ and /θ/
Free [fri] Three [θri]
- Minimal pairs /s/ and /θ/
Sink [sɪŋk] and Think [θɪŋk]
- minimal pairs /ð/ and /z/
With [wɪð] and Whizz [wɪz]
- Minimal pairs /d/ and /dʒ/
Bad [bæd] and Badge [bædʒ]

b. Vowel minimal pairs, for example:

- Minimal pairs /ɪ/ and /i:/
Sit [sɪt] and Seat [si:t]
- Minimal pairs /ɛ/ and /i/
Desk [desk] and Disk [dɪsk]
- Minimal pairs /ɛ/ and /eɪ/
Wet [wet] and Wait [weɪt]

- Minimal pairs /æ/ and /ʌ/
Bat [bæt] and *But* [bʌt]
- Minimal pairs /əʊ/ and /ɔ:/
So [səʊ] and *Saw* [sɔ:]
- Minimal pairs /ɑ/ and /oʊ/
Not [nɑt] and *Note* [noʊt]
- Minimal pairs /æ/ and /ɛ/
Bad [bæd] and *Bed* [bed]
- Minimal pairs /ɑ:/ and /ɜ:/
Fast [fɑ:st] and *First* [fɜ:st]

on the other hand, the perspective of phonemic position refers to a way of contrasting the pronunciation of two words based on the position of phonemes that we recognize initial, medial, as well as final minimal pairs.

a. Initial minimal pairs, for example:

- minimal pairs /f/ and /p/
Fast [fɑ:st] and *Past* [pɑ:st]
- minimal pairs /k/ and /g/
Came [keɪm] and *Game* [geɪm]
- minimal pairs /t/ and /d/
Two [tu:] and *Do* [du:]

b. Medial minimal pairs, for example:

- Minimal pairs /eɪ/ and /ɛ/
Paper [peɪpə] and *Pepper* [pepə]
- Minimal pairs /ɒ/ and /ʌ/
Poppy [pɒpi] and *Puppy* [pʌpi]
- Minimal pairs /ɜ:/ and /i:/
Purple [pɜ:pl] and *People* [pi:pl]

c. final minimal pairs

- minimal pairs /k/ and /g/
Back [bæk] and *Bag* [bæg]
- Minimal pairs /s/ and /ʃ/
puss [pʊs] and *push* [pʊʃ]
- minimal pairs /t/ and /d/
Hat [hæt] and *Had* [hæd]

Referring to the above examples, it is clearly seen that minimal pairs basically indicate that two words have similar pronunciation which only differs in one sound. as for native speakers of english for example, recognizing minimal pairs is very easy, but non-native speakers will find it difficult and this difficulty frequently requires them to look up the pronunciations of a pair of words in an english dictionary to make sure that they are clearly able to differentiate the similar sounds in the words. The difficulty encountered by non-native speakers with minimal pairs may cause language problems in the area like listening and speaking skills. So, being familiar and practicing with minimal pairs will enable non-native speakers to contrast two words with similar pronunciation and this ability is certainly very useful to help them not only in understanding words correctly, but also in articulating the words properly.

2.2. Non-contrastive Sounds: Allophone

In this part, we are going to discuss the representation of non-contrastive sounds namely Allophone. To understand about this, it is essential to know what allophone is. allophone is the sound variants of the same phoneme (Poole, s. c. 1999). for example, phoneme /t/ in english is sometimes pronounced sound [t] as in the word ‘stop’ [stɒp] and is sometimes is pronounced in the aspirated form [tʰ] as in the word ‘time’ [tʰaɪm]. Therefore, sound [t] and sound [tʰ] are considered as the sound variants or the allophones for the phoneme /t/. according to nordquist, r. (2018), when a speaker substitutes one allophone for another allophone of the same phoneme in a certain word, it doesn’t lead to a different word, just a different pronunciation of the word which does not lead to different meaning at all. therefore, allophones are said to be non-contrastive.

the allophone is categorized into two types i.e. situational allophone and preferential allophone. situational allophone occurs when sound variants are made due to a phoneme’s position and different phonetics environment in a word. The position of a phoneme in a word can be initial, medial, or final position. On the other hand, phonetic environment refers to the nearby sounds around a phoneme e.g. in the word ‘time’ [taɪm], [t__m] is the environment for the phoneme /aɪ/. For details, let’s take a look at this example, phoneme /p/ in english may have three variants of speech sound namely strongly aspirated

[p^h], weakly aspirated [pʰ], and unreleased [p-]. These sound variants are determined by the position and the environment of phoneme /p/ in the word. For example:

- When phoneme /p/ is in initial position and in the environment before a vowel [__high front vowel] e.g. 'pill' [pɪl] then strongly aspirated allophone [p^h] is produced.
- When phoneme /p/ is in medial position and in the environment between a consonant and a vowel [voiceless alveolar fricative consonant __high front vowel] e.g. 'spill' [spɪl] then weakly aspirated allophone [pʰ] is produced.
- When phoneme /p/ is in final position and in the position after a vowel [low back vowel __] e.g. 'stop' [stɒp] then unreleased allophone [p-] is produced.

The allophones of a certain phoneme which occur in different phonetic environments as the examples are then called as complementary distribution. The typical characteristic of a complementary distribution is that one allophone will only be found in a certain environment, while other allophones will never be found in the same environments, but in the different environment instead.

Besides, preferential allophone occurs as sound variants are made due to speakers' unconscious freedom to choose the allophone. Skandera, P., & Burleigh, P. (2005) make effort to explain this by saying that "The choice of one allophone rather than another may depend on such factors as communicative situation, language variety, and social class". Due to the factors, the choice of allophone may vary from person to person and communicative situation to communicative situation. Therefore, this kind of allophone tends to be free variation. Free variation refers to the act of pronouncing a word in which one phoneme in the word is switched for another in the same phonetic environment that produces two versions of speech sound without changing the word's meaning, in which the use of free variation occasionally takes place because of the speakers' different background as mentioned by Skandera, P., & Burleigh, P. (2005). For example, as an American and a British English speaker are differently pronounced the word 'tomato' as [tə'meɪ,təʊ] and [tə'mɑ:təʊ]. From this example, we can clearly see three facts namely:

- The free variation is allophone [ɑ:] for the phoneme /eɪ/ or allophone [eɪ] for the phoneme /ɑ:/.
- The allophones take place in the same phonetic environment [tə'm____təʊ].
- The speech sound /eɪ/ and /ɑ:/ are heard as two different sounds but do not change the meaning of the word 'tomato'.

for the reason, free variation sound is also known as one type of allophones.

3. Phonological Rules

The idea of phonological rules is very closely related to the linguists' hypothesis about the existence of a set of rules in humans' mind that allows them to produce intelligible language products when they communicate with one another. This set of rules is seen as an abstract representation of human speech in language. When humans are speaking, the rules in their mind automatically work and the results are language products that we perceive. In other words, the rules of language existing in humans' mind are transformed into language products such as speech sounds, words, phrases, and sentences that contain meanings. Among these rules, phonological rule is one type that works to produce communicating speech sounds in humans' social interactions. The question to answer now is what are phonological rules? According to Goldsmith, J. A., Riggle, J., & Alan, C. I. (2011), phonological rules are maps that exist in humans' mind connecting between two levels of sounds' representation, namely the abstract or underlying levels and the surface levels. Whereas Hayes, B. (2009) defines phonological rules as generalizations about the ways of different speech sounds produced in different phonetic environments. In addition, Crane, I. B., Yeager, E., & Whitman, R. I. (1981) explain that phonological rules are a mechanism carried out in the human mind that modifies linguistic entities to produce new linguistic entities by removing elements, adding elements, or even changing elements. Based on these three definitions, we can clearly understand that phonological rules basically explain how speakers of certain languages produce speech sounds starting from functioning or modifying abstract representations in their minds (in terms of adding, removing, or changing), to producing the actual speech sounds they articulate when speaking.

In more detail, Curzan, A. & Adams, M. (2013) classify phonological rules into seven major types of phonological rules by referring to phonological processes they involve. They are assimilation, dissimilation, insertion, deletion, metathesis, fortition, as well as lenition. This classification provides a very clear picture of how speakers of certain languages realize the abstract representations of language in their minds into tangible language products in the form of meaningful words, phrases and sentences. Therefore, a detailed explanation of the seven phonological rules is described as follows:

3.1 Assimilation

Assimilation is one of the phonological rules which explains how a certain sound changes to become more like another sound (assimilate) in its immediate phonetic environment (a nearby sound). Some linguists are of the opinion that assimilation commonly occurs because of rapid speech delivery made by speakers when speaking. Assimilation can take place in a word, for example; the word 'handbag' is normally pronounced [ˈhændbæg], but in rapid speech, this word can go through an assimilation process, in which it is often pronounced [ˈhæmbæg]. Besides, assimilation can also take place between words, for example; the words 'in between' are normally pronounced [ɪnbɪˈtwiːn], however, in rapid speech, the pronunciations of the two words may become [ɪnbɪˈtwiːn]. Another example of assimilation between words can be seen when native speakers of British English pronounce the words 'ten balls' as something that sounds like [tɛmbɔːlz] substituting [tɛnbɔːlz]. As for the native speakers, the phoneme /n/ changes to phoneme /m/ due to the presence of phoneme /b/ in the nearby word. From the three examples, we can clearly see a rule which governs the assimilation of a particular phoneme, by which phoneme /n/ as an alveolar nasal sound changes to phoneme /m/ as a bilabial nasal sound when the phoneme /n/ is followed by a bilabial stop sound, like phoneme /b/.

3.2 Dissimilation

The second rule in phonology to be discussed in this section is dissimilation. Dissimilation can be understood as a phenomenon by which one sound in a word is changed (dissimilatory change) or omitted (dissimilatory omission) that consequently makes the pronunciation of the word dissimilar.

An example of dissimilatory change is the pronunciations of the words ‘fifth’ [fɪfθ] and sixth [sɪksθ] which end with voiceless dental fricative sound /θ/. In real communications, either native English speakers or non-native speakers of English consider this sound as a challenge that they frequently change the voiceless dental fricative sound /θ/ to a voiceless alveolar stop sound /t/ in rapid speech. Consequently, both words are pronounced to be slightly different to be [fɪft] for the word ‘fifth’ and [sɪkst] for the word ‘sixth’. In addition, the example of the dissimilation of omissions can be seen in the words ‘governor’ [ˈgʌvərnər], ‘surprise’ [səˈpraɪz] and ‘particular’ [pəˈtɪkjələr]. In pronouncing the three words, sound /r/ should be clearly articulated, but in the rapid speech of the three words, sound /r/ tends to disappear that the pronunciation of the three words is slightly dissimilated from their proper pronunciation, where the word ‘governor’ is pronounced [ˈgʌvənər], the word ‘surprise’ is pronounced [səˈpraɪz], and the word ‘particular’ is pronounced [pəˈtɪkjələr]. When this phenomenon is analyzed, the sound dissimilation which occurs by omitting sound /r/ is caused by a rule used by native English speakers that when sound /r/ occurs before voiceless bilabial stop /p/ sound, voiceless alveolar stop /t/, and voiced alveolar nasal /n/, then sound /r/ tends to be omitted which consequently causes dissimilatory omission.

3.3 Insertion

Insertion is the third type of phonological rule where an extra sound that should not present in slow speech is added between two other sounds in a word in rapid speech. There are several words that can be given as examples related to the rule of insertion in English. The first word is ‘dance’, in slow pronunciation, this word is pronounced [dæns], but when the word is pronounced by native English speakers in fast speech, there is an addition of sound /t/ between phonemes /n/ and /s/ so that the pronunciation of the word ‘dance’ becomes [dænts]. The second word is the word ‘strength’. In normal speech, this word is pronounced [streŋθ], but when this word is pronounced in rapid pronunciation by native English speakers, the pronunciation of the word becomes [streŋkθ], where there is an addition of sound /k/ between phonemes /ŋ/ and /θ/. The third example is the word ‘hamster’. This word is pronounced [ˈhæmstər] in normal pronunciation, but when this word is pronounced by native English speakers in fast pronunciation, the pronunciation of the

word becomes [ˈhæmpstər] where there is an insertion of sound /p/ between phonemes /m/ and /s/.

3.4 Deletion

Deletion is the fourth phonological rule that describes a phenomenon in which one or more sounds (either vowel sounds or consonant sounds) are omitted from the pronunciation of a word. In linguistics, deletion has synonyms namely elision. In this discussion, these two terms can be used interchangeably, although in the view of some linguists, there are those who argue that the word elision is more often used to explain the omission of sounds in the language that still exists. on the other hand, the word deletion is more often used to explain the omission of sounds related to historical linguistic point of view.

In English, the phenomenon of sound deletion can be exemplified in the deletion of sound /t/ in the pronunciation of a word. at least, there are two general rules regarding the deletion of this sound. *The first*, the /t/ sound which is located at the end of the pronunciation of a word is omitted if the sound is between two consonant sounds, where the second consonant sound is the first sound of a word linked with the first word. This first rule can be illustrated in the following figure:

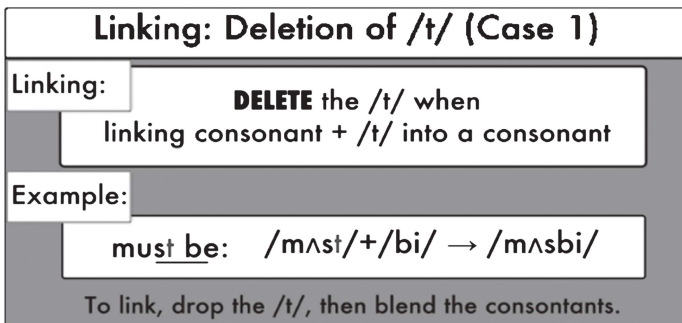

Figure 13

The first case of the deletion of sound /t/ in English

Source: <https://pronuncian.com>

When figure 13 is analyzed, we will know that as the pronunciation of a word ends with a consonant sound /t/, then the sound is connected with another word whose initial sound is also a consonant, then the consonant

sound /t/ in the first word is often omitted. Here are the other examples: first□day[fɜrst□deɪ] becomes [fɜrs□deɪ], best□friends [best□frɛndz] becomes [bes□frɛndz], and interest□rates ['ɪntrɛst□reɪts] becomes ['ɪntrəs□reɪts]. *The second*, the sound /t/ which exists at the end of a word's pronunciation experiences deletion when the /t/ sound is linked with a word whose initial sound is a vocal sound. This second rule can be illustrated in figure 14as follows.

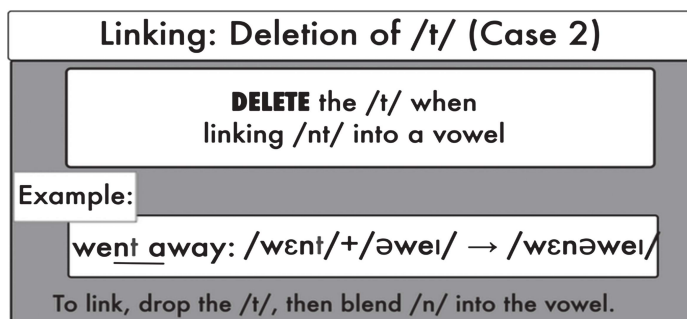

Figure 14
The first case of the deletion of sound /t/ in English
Source: <https://pronuncian.com>

The deletion of sound /t/ in this second rule can be exemplified in words such as: percent□of [pɛr'sɛnt□ʌv] becomes [pɛr'sɛn□ʌv], president □announced ['prɛzə,dɛnt□ə'naʊnst] becomes [prɛzə,dɛn□ə'naʊnst], and apartment□in [apartmɛnt□ɪn] becomes [apartmən□ɪn]. However, it should be noted that the case of the deletion of sound /t/ discussed in this section is just one example of a number of cases within English language. This example is given to show how the deletion phenomenon takes place in the pronunciation system especially in e nglish.

3.5 Metathesis

metathesis is one of the phonological rules that occurs when two consonants in a syllable are placed in a different order, or the position of one consonant is replaced by a vocal sound. If the two consonants only switch positions, this phenomenon is called switching, but if the position of the two consonant sounds are switched and one of the consonant sounds transposes its position with the position of one vocal sound, then this phenomenon is called transposition. according to williamson, g (2016), switching refers to

a reversal phenomenon of two consonant sounds which generally occurs in two consonant clusters in the final position syllable of a word. For example, the word ‘mask’ [mæsk] becomes [mæks]. The example indicates that the two consonant sounds at the end of the syllable /-sk/ are reversed to /-ks/. Therefore, Williamson, G. (2016) illustrates the switching pattern as follows:

$c_1c_2 \rightarrow C_2c_1$ for example the word ‘task’ [tæ-s₁k₂] becomes [tæk₂s₁]

In addition, transposition according to Williamson, G. (2016) refers to a phenomenon of the position transition of two consonant sounds, but the position of one of the consonant sounds is replaced by a vocal sound. For example the word ‘prescription’ [prə'skrɪpʃən] becomes [pər'skrɪpʃən]. In this regard, Williamson, G. (2016) also illustrates the transition pattern as follows:

$C_1C_2V \rightarrow C_1VC_2$ for example the word ‘introduction’ [ɪnt₁r₂ə'dʌkʃən] becomes [ɪnt₁ər₂'dʌkʃən]

Basically, metathesis is not a pronunciation rule that shows the form of standard pronunciation of native English speakers, but is a form of pronunciation errors made by native English speakers in their natural speech. Therefore, metathesis is considered as one of the causes of natural speech errors due to the rapid speech of a word.

3.6 Fortition (Strengthening)

Fortition is one of the phonological rules that shows the phenomenon of changing a consonant sound from a weak consonant sound to a strong consonant sound. Producing a strong consonant requires stronger degree of muscular effort and breath force. This kind of strengthening consonant sound is called fortis consonant. For example, a speaker is changing a fricative sound /f/ into a full stop consonant sound /p/. As a representative example taken from my experience in teaching speaking skills of English, many Indonesian learners tend to operate fortition rule when they pronounce the word ‘have’ [hæv] by which the fricative sound /v/ is changed into a stop sound /p/ that the word ‘have’ is pronounced [hæp]. According to Goblirsch, K. G. (2012), the

aspiration of stop sounds may be categorized as fortition because it is made with stronger degree of muscular effort and breath force, e.g. the pronunciation of the word ‘time’ [tʰaɪm] is commonly pronounced as an aspirated stop sound [tʰaɪm] by most native speakers of English. Strengthening of a stop consonant sound in a word is done by native English speakers to show an emphasis or extra expressions such as exclamation, surprise, admiration, as well as disappointment. for example:

- The expression of exclamation as in the word ‘beautiful’ [ˈbju:təfəl]. Stop sound /b/ in the word is strongly pronounced to be [beejutəfəl].
- The expression of surprise as in the word ‘impossible’ [ɪmˈpɔ:səbəl]. stop sound /p/ in the word is strongly pronounced with aspiration [ɪmˈpʰəsəbəl].
- The expression of admiration as in the word ‘fantastic’ [fænˈtæstɪk] Stop sound /t/ in the second syllable is strongly pronounced with aspiration [fænˈtʰæstɪk].
- The expression of disappointment as in the word ‘damn’ [dæm]. Stop sound /d/ is pronounced as an aspirated stop sound [dʰæm].

3.7 Lenition (weakening)

lenition is the last phonological rule discussed in this section. this phonological rule shows the weakening phenomenon in articulating a consonant in the pronunciation of a word. weakening means that the consonant is produced with relatively weak degree of muscular effort, this kind of consonant is called lenis consonants. for example, a speaker is changing a full stop sound e.g. /p/ (it requires much amount of energy) into a fricative sound /f/ (it requires a little amount of energy). according to Honeybone, P. (2012), there are four types of lenition i.e. spirantization, approximantization, debuccalization, as well as voicing.

- spirantization refers to a process of weakening a consonant sound from a stop consonant into a fricative consonant, for example from a stop consonant/p/ to a fricative consonant /f/, or from a stop consonant /t/ to a fricative consonant /s/. in Irish english, spirantization is usually heard when words ending in /t/ sounds are articulated for example the word ‘right’ [raɪt] or ‘cat’ [kæt], where the consonant sound /t/ tends to be weaken to be a fricative sound /s_h/ so the word ‘right’ is pronounced

- [raɪ's_h] and the word 'cat' is pronounced [kæ'ts_h].
- furthermore, approximantization is a phonological process that shows the occurrence of stop consonant weakening (fully blocking the air flow) into an approximant consonant (not fully blocking the air flow), for example in the word 'kitty' ['kɪti] where the consonant sounds stop /t/ experience sound weakening becomes an approximant consonant /r/ that the word is pronounced ['kɪri].
 - Next, debuccalization is one type of lenition that is often defined as a phenomenon of weakening a consonant sound into a glottal fricative sound (e.g. /h/ or /ʔ/). Many native speakers of American and British English apply this rule by weakening the stop consonant sound /t/ to a glottal fricative sound /ʔ/. For example, the words 'get ready' [gɛt'redi] become [gɛʔ'redi], 'not much' [nɒtmʌʃ] become [nɒʔmʌʃ], 'mountain' ['maʊntən] becomes ['maʊnʔən] etc.
 - the last, voicing is a phonological rule that shows the weakening of a consonant sound based on the aspect distinctive feature, where a voiceless consonant sound is pronounced to be a voiced consonant because of a phonemic environment. For example, the use of suffix -s in making plural nouns of English, as the suffix -s [voiceless] is located after a voiceless consonant sound e.g. phoneme /t/ as in the word <cats> [kæts], so suffix-s is still pronounced [s]. However, when suffix -s is placed after a voiced consonant sound e.g. phoneme /g/ as in the words 'dogs' [dagz], the pronunciation of suffix-s will change into [z].

It should be emphasized here that knowledge of the seven phonological rules is very useful for two things. *The first*, some of the rules can be used as pronunciation patterns that can be taught to learners of English because the rules show the natural characteristics of the pronunciation system of native English speakers. with one important note, the rules do not indicate the characteristics of speech errors. *The second*, the phonological rules can be used as instruments to analyze and to explain how the sounds of a certain language are produced by the speakers of the language, that the results of analysis using these rules can be used as data to distinguish the pronunciation systems from one language to another.

CHAPTER FIVE

UNDERSTANDING MORPHOLOGY

Morphological information has provided the greatest single source of data in the formulation and development of the theory of evolution and that even now, when the preponderance of work is experimental, the basis for interpretation in many areas of study remains the form and relationships of structures.

(Everett C. Olson)

The human brain has been designed by Allah The Almighty to understand and to produce language products (speeches and texts) in facilitating humans to communicate ideas with each other. The language used by humans contains countless words, phrases, and sentences. All the language elements are stored in mentallexicon (humans' internalized knowledge of the properties of a language) and are ready to be used anytime, anywhere in the form of language skills such as speaking, listening, writing as well as reading. Although the language skills seem to be different, there is one main component, which if the component is owned, then at least humans are able to function the four skills. The main component is the word. By having the knowledge of words, humans can talk, listen, write and read. The discussion in this section focuses on the study of words that humans use to communicate. The study is widely known as morphology.

1. The Word 'Morphology' Defined

To understand morphology clearly, we must first understand the basic concepts that exist in the study. The basic concepts can be known by examining the definition of morphology. The definition of morphology will

be assessed using two perspectives, namely the definition of morphology from the perspective of online sources (e.g. online dictionaries) available on the internet and the definition of morphology from the perspective of linguists' views at different periods of time. If we search the definition of morphology from online sources, we will find the definition as follows:

- According to <https://en.wikipedia.org>, “morphology in linguistics is the study of words, how they are formed, and their relationship to other words in the same language. It analyzes the structure of words and parts of words, such as stems, root words, prefixes, and suffixes”.
- In <https://www.britannica.com>, “morphology, in linguistics, is defined as the study of the internal construction of words. languages vary widely in the degree to which words can be analyzed into word elements, or morphemes”.
- <https://www.collinsdictionary.com> defines “morphology as the branch of linguistics that deals with word structure and with functional changes in the forms of words, such as inflection and compounding”.
- according to <https://www.dictionary.com>, “morphology in linguistics is defined as the study of the patterns of word formation in a particular language, including inflection, derivation, and composition”.
- In <https://www.merriam-webster.com>, “morphology is defined as a study and description of word formation (such as inflection, derivation, and compounding) in language”.

In addition to the definitions, we still need to examine the definition of morphology from the second source that is how linguists define morphology, which are as follows:

- Crane, L. B., Yeager, E., & Whitman, R. L. (1981) define “morphology as the study of words and their smaller units of meaning which are formed in particular ways (the rules governing them)”.
- According to Anderson, S. R. (1992), “morphology, in linguistics, is the study of the forms of words, and the ways in which words are related to other words of the same language”.
- Becker, A., & Bieswanger, M. (2004) are of the opinion that “morphology means talking about words and studying their “anatomy” (the internal structure of words) to know how words are created, structured and changed”.

- Aronoff, M., & Fudeman, K. (2011) are of the opinion that “morphology, in linguistics, refers to the mental system involved in word formation or to the branch of linguistics that deals with words, their internal structure, and how they are formed”.
- According to Booij, G. (2012), “morphology deals with the systematic correspondence between the form and meaning of words. The study of these regularities comprises the domains of inflection and word formation”.

If the definitions from the two different sources are analyzed, we will find at least three key words concerning morphology which are mutually shared among the definitions i.e. word structure, word pattern and word formation. Therefore, to understand the definition of morphology more clearly, it is better to discuss a little about these three keywords.

a. Morphology studies word structure

word structure refers to a process of constructing words consisting of basic elements that make up the words. The basic elements are also referred to as the internal structure of word. according to aronoff, m., & Fudeman, K. (2011), the basic elements of word formation (internal structure) are morphemes (the smallest unit of a word) and affixes (a type of morpheme attached to a word stem). These two basic elements will be discussed in more detail in the next section.

b. Morphology: the study of word pattern

word pattern refers to the process of constructing words that is done in a regular way following a certain pattern to meet the demand of grammatical functions of a language. for example, the pattern of constructing plural nouns or the pattern of constructing verbs in affirmative sentences of simple present tense. Kazemian, B., & Hashemi, S. (2014) are of the opinion that a word which is constructed by adding an affix according to the rules of grammar of a language is called inflection.

c. Morphology: the study of word formation

Word formation refers to a process of forming other words by using morphemes that has an impact on changing meaning. according to Becker, a., & Bieswanger, m. (2004), the formation of other words can be categorized into two types, namely productive word formation and less productive word formation. there are two productive word formations

i.e. compounding and derivation. on the other hand, there are at least seven less productive word formations i.e. coinage, borrowing, blending, clipping, backformation, conversion and acronyms. These two types of word formations will be discussed in detail in the next section.

after understanding the three keywords taken from the two sources that present the definitions of morphology, then morphology, in this book, may be defined as one of the branches of linguistics which specifically examines the structure of words, the patterns of words and the formation of words used by humans in a language. From this definition, we can then find out clearly that studying morphology means to study all about word.

2. Understanding Word, Lexeme and Word-Form

Before we begin the discussion of word from a morphological point of view, it is a good idea to first understand what a word is, and how it differs from the terms lexeme and word-form. If a native English speaker is speaking to us by stating a sentence like this 'the man always drives his car in the afternoon'. among the words used to construct the sentence, we don't understand the meaning of the verb 'drives', then we will probably open the dictionary and look up the word 'drive', but not look up the word 'drives'. After we find the entry for 'drive', we expect to find information regarding the spelling and pronunciation of the word, the meaning of the word as well as its interpretation, or we will even find other information about derivative word forms from the word 'drive' such as 'drove', 'driven', 'driving' etc. If we focus our attention on the word 'drive', then the word 'drive' may be recognized as what we call **word**. It is recognized as a word for three reasons, namely:

- The word 'drive' is the smallest element that can be uttered or written.
- The word 'drive' has its own word class form that it is a verb.
- The word drive can stand alone and be used separately from other words, but still has meaning.

Based on these three reasons, word may then be defined as the smallest element of language that can be uttered or written, has a word class form, and still has meaning even if it stands alone. Furthermore, Beare, K. (2018) is of the opinion that words can be divided into two types, namely content words and

function words. content words refer to words that can provide information about the meanings of the words (contents) we use in communication. Content words are usually nouns, verbs, adjectives and adverbs. A noun informs about a particular object. A verb informs about the action that is taking place. An adjective informs about the details of an object, a person, and a place. An adverb informs about how, when, or where something is done. On the other hand, function words refer to words that function to form grammatically correct sentences. function words are usually Pronouns, determiners, prepositions, conjunctions, and auxiliary verbs. Meanwhile, all possible forms of the word 'drive' such as the words 'drove', 'driven', 'drives', and 'driving', are then referred to as *lexeme*. In addition, a lexeme that is used for a certain condition to meet the demand of a grammatical function, for example the word 'drove' as one of the lexemes of the word 'drive' is used to fulfill a grammatical function in forming a sentence which expresses past action, the lexeme 'drove' is known as *word-form* (Bauer, 1983).

3. Word Structures: Morphemes

Every language in the world has its own structure that can be broken down from the largest components to the smallest ones. The components of the language are commonly recognized as the grammatical units (syntactical rules), in the form of sentences, clauses, phrases, words, and the smallest unit of a word but still has meaning or is widely known as a morpheme. Whereas a letter in the spelling of a word represented in the form of the smallest unit of sound (phoneme) and syllable cannot be considered as the grammar units (syntactical rules) because they are part of the pronunciation system in a language (phonological rules). Specifically, Becker, A., & Bieswanger, M. (2004) define morpheme as the smallest unit of a language that not only contains meaning, but also carries lexical information and grammatical information. Let us see the example in an English word that has a single morpheme, such as the word 'enterprise' (a profit oriented company or business organization). If we want to say a small-scale profit-oriented company (a small company), then we can say micro-enterprise by adding a prefix micro- to the beginning of the word 'enterprise'. Then, if we want to talk about more than one small profit-oriented company, we can say 'micro-enterprise-s' by adding a plural marker -s at the end of the word 'micro-

enterprise'. so, what we can see in the word micro-enterprises is a word which consists of three individual morphemes namely morpheme micro-, enterprise, and -s. Morpheme 'enterprise' is a base word known as root (a part of a word which cannot be reduced into a smaller unit anymore and to which affixes may be added). Morpheme micro- is a prefix that is used to form a new word from the pre-existing base word 'enterprise', that morpheme micro-is said to carry lexical information. meanwhile, morpheme-s is used to indicate plural number, so the morpheme-s is said to carry the grammatical function of plural noun in the formation of the word 'micro-enterprises'. Hence, we can conclude that a morpheme has three basic characteristics, namely *the first*: it is a word or part of a word that has meaning, *the second*: it cannot be divided into a smaller meaningful segment anymore, and *the third*: it relatively carries lexical functions or grammatical functions in the formation of a new word.

3.1 Types of Morpheme

to understand morpheme in detail, let's have a look and analyze the following words to find out what types of morphemes are used in forming these words.

- a. **Needed**: this word is formed by two morphemes, namely morpheme 'need' as a root in the form of a verb (meaning require something) and morpheme -ed as a past form marker. merging these two morphemes to form a new word does not change the lexical function (after the suffix -ed is added a new word 'needed' is formed without changing its lexical status as a verb) but changes the grammatical function (suffix -ed indicates that the action occurs in the past).
- b. **Reads**: this word is also formed by two morphemes, namely morpheme 'read' as a root in the form of a verb (meaning to look at and understand the meaning of written language) and morpheme -s as a present form marker added to the verb of an affirmative sentence that has a third singular pronoun. merging these two morphemes to form a new word 'reads' does not change the lexical function (after the suffix -s is added, another word 'reads' is formed without changing its lexical status as a verb) but changes the grammatical function (suffix -s indicates that the action occurs in the present time).

- c. **Suggestion:** this word consists of two morphemes, namely morpheme “suggest” as a root (meaning to mention an idea for other people to consider) and morpheme -ion as a noun-forming suffix. Merging these two morphemes changes the lexical function of this word from a verb to a noun (after the suffix –ion is added to the root ‘suggest’).
- d. **Endanger:** this word also consists of two morphemes, namely morpheme en - as a prefix forming verb and the morpheme ‘danger’ as a root (a noun which means something or someone that may harm). adding morpheme en- as a prefix to the morpheme ‘danger’ as a root has formed a new word ‘endanger’ in which the lexical function of the word has also changed from a noun to a verb.

If the four words exemplified are analyzed, we will find two types of morphemes. The first type is the morphemes which can stand alone in the sense that they still have specific meaning even though they are not attached to other morphemes. for example: morphemes need, read, suggest, and danger. These types of morphemes are called free morphemes. The second one is the type of morphemes which cannot stand alone, meaning that the morphemes have no specific meaning if they stand alone. Such morphemes will only have specific meaning if they are attached to free morphemes. For example: suffixes -ed, -s, -ion and prefix en-. These types of morphemes are called bound morphemes. Thus, it can be concluded that morpheme has basically two types i.e. the first type is free morpheme (in the form of root or base) and the second one is bound morpheme (in the form of affixes either prefix or suffix).

3.2 Affixes

An affix is a bound morpheme that is attached to a free morpheme (root) to form a new word which may bring changes in meaning, lexical function or grammatical function. In this regard, Becker, a., & Bieswanger, m. (2004) comment that all bound morphemes are affixes that are attached to other free morphemes. They also state that affixes play a vital role in expressing grammatical information and building other words. The morphological process in which an affix is attached to a bound morpheme resulting in a change in meaning, lexical function or grammatical function is called affixation. In English, we generally recognize three types of affix based on form (form-based affixes), namely:

- **Prefix:** it may be defined as an affix attached to the front of a free morpheme (root) to form a new word. For example, affix Re- is attached to the front of the root 'write' (a verb means to create something that can be read) to form a new word 'rewrite'. The Prefix Re- attached to the root 'write' has added the meaning 'again' to the root that the new word 'rewrite' becomes a verb that means to write something again.
- **Suffix:** it may be defined as an affix attached to the end of a free morpheme to create a another word. For example, an affix -er is attached to the end of a root 'sing' (a verb meaning to produce musical tones by using the voice) to form a new word 'singer' (a noun meaning a person who produces musical tones by using the voice). The suffix -er attached to the root 'sing' not only changes the meaning but also changes the lexical function of the root (from a verb to a noun).
- **Circumfix:** it may be defined as a process of forming a another word by attaching a prefix and a suffix to a free morpheme simultaneously (at the same time). For example, the prefix em- and suffix -ment are attached to a free morpheme "power" (a noun meaning ability to do something) to form a another word "empowerment" (a noun meaning an authority given to someone to do something). The attachment of prefix em- and suffix -ment simultaneously to the free morpheme "power" has given a change of meaning even though it does not change the lexical function.

In addition to the three types of form-based affixes, we also recognize two types of affix based on function (function-based affixes) namely derivational affixes and inflectional affixes.

- **Derivational affixes:** There are a large number of derivational affixes in english. nordquist, r (2018) is of the opinion that the set of derivational affixes is open-ended which means there are a potentially infinite number of them (even if the number is finite at any one time for a particular speaker). Therefore, it would be impossible to enumerate them exhaustively. These types of affixes are used to derive another words that function to change meaning and sometimes change lexical functions of the resulting words. For example, adding the prefix dis- to the word 'agree' changes the meaning of 'agree'. t he resulting word is 'disagree' which means 'not agree'. Another example, the addition of suffix -ness to the word 'happy' changes the lexical function of the word 'happy' as

an adjective. The resulting word is 'happiness' with lexical function as a noun. To support this explanation, Becker, a., & Bieswanger, m. (2004) state that derivational affixes are used to create another words that allow changes in meanings and lexical functions (part of speech).

- **Inflectional affixes:** inflectional affixes are generally suffixes. If a suffix is attached to a free morpheme, a another word will be formed and the resulting word shows the grammatical function. In english, there are at least eight types of inflectional suffixes, namely:
 - a. Suffix –s to indicate noun plural. For example, car + s = cars (-s is a plural marker).
 - b. Suffix –'s to indicate noun possessive. For example, John+'s = John's (-'s is a noun possessive marker).
 - c. Suffix –s to indicate verb tense for the third person singular. For example, write+s = writes (-s is a verb tense marker for the third person singular).
 - d. Suffix –ing to indicate verb present participle or gerund. For example, try+ing = trying (-ing is a verb present participle or gerund marker).
 - e. Suffix –ed to indicate verb simple past tense. For example, work+ed = worked (-ed is a verb simple past tense marker).
 - f. Suffix –en to indicate verb past perfect participle. For example, take+en = taken (-en is a verb past perfect participle marker).
 - g. Suffix –er to indicate adjective comparative. For example, low+er = lower (-er is an adjective comparative marker).
 - h. Suffix –est to indicate adjective superlative. For example, happy+est = happiest (-est is an adjective superlative marker).

Although there is a division of functions in the use of affixes in English language, it does not mean that each affix only carries out one function either the function of derivation or inflection, but it is also possible for one affix to carry out two functions at once. Hamawand, Z. (2011) states that some inflectional suffixes not only show grammatical functions but also show lexical functions such as suffixes *-ed*, *-en*, *-er*, *-ing* and *-ly*. Suffix –er, for example, can run two functions, namely as inflectional suffix and as derivational suffix. As an inflectional suffix, suffix –er may bring grammatical function to a another word e.g. the suffix -er is attached to an adjective to

show the function of comparative degree as in the word ‘hotter’ which means having higher temperature. As a derivational affix, suffix -er can be more productive in creating other nouns if it is attached to the root verbs such as walk + er = walker, sing + er = singer, read + er = reader, etc. Based on the description, it can be concluded that morphemes really have a very vital role in words formation of English. Morphemes are determining components in the structure of word formation as illustrated in the following figure.

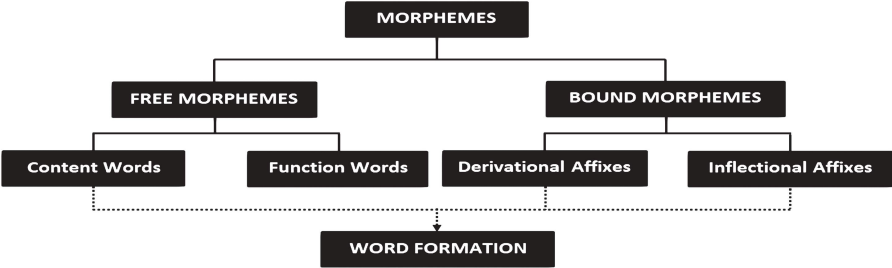

Figure 15
Internal Structure of English word formation

4. Word Pattern: Inflections

As stated earlier that word pattern could be illustrated as to construct words by following a regular pattern to satisfy the demand of particular grammatical functions in a language, which is also known as inflection e.g. constructing words by following the pattern of regular plural noun in English (e.g. adding suffix –s to the end of a noun) such as car-cars, book-books, chair-chairs etc. Inflection takes place by adding a suffix to a word (e.g. verb, adjective, noun as well as adverb) to encode grammatical categories to the words such as plural, possession, tense, or comparison (Plag, I. 2018). Some affixes in inflection may do two or three duties. For instance, adding suffix –ed to a word may do two duties namely to make past tense or past participle. Besides, adding suffix –s to word may do three duties namely to make plural nouns, a verb for the third singular person in simple present, and possession when being used with an apostrophe. According to Shamsan, M. A. H. A., & Attayib, A. M. (2015), there are three basic types of Inflection in English i.e. inflection of nouns, inflection of adjectives, and inflection of verbs. The following is a brief discussion of the types.

4.1 Inflection of nouns

In English, inflection of nouns is intended to show a more specific meaning about the noun in the form of numbers (singular to plural) and possession.

4.1.1 Pluralization

The act to change the meaning of a singular noun into a plural noun by using inflection is called pluralization. Broadly speaking, there are two types of rules for pluralization in nouns namely: regular pluralization in singular nouns and irregular pluralization in singular nouns. Regular pluralization refers to the process of attributing plurality to a singular noun which is generally done by using several basic rules such as adding suffix -s or -es to the singular noun. The rules of regular pluralization are normally consistent and predictable. Whereas irregular pluralization refers to the process of attributing plurality to singular nouns which is done not by adding the suffix -s or -es as most nouns in English do, but simply done by using plural patterns of the nouns. The plural patterns are commonly borrowed from Latin or Greek plural formation (2018, August 21). More specifically, the rules of both types of pluralization are applied as follows.

Rules for regular pluralization

- a. Making regular nouns plural by adding affixes to the end of the noun.

Singular noun type	Plural due to inflection –s
c hair	c hairs
Table	Tables
Paper	Papers
animal	animals
c computer	c computers

- b. Making singular nouns end in s, -ch, -sh, -x, or -z plural by adding affixes to the end of such nouns.

Singular noun end in –s	Plural due to inflection –es
Bus	Buses
lens	lenses
kiss	kisses
Boss	Bosses
gas	gases

Singular nouns end in –ch	Plural due to inflection –es
coach	coaches
Bench	Benches
Branch	Branches
church	churches
watch	watches

Singular nouns end in –sh	Plural due to inflection –es
Brush	Brushes
Bush	Bushes
dish	dishes
wish	wishes
crash	crashes

Singular nouns end in –x	Plural due to inflection –es
Box	Boxes
fox	foxes
tax	taxes
Influx	Influxes
Affix	Affixes

Singular nouns end in –z	Plural due to inflection –es
Blitz	Blitzes
Buzz	Buzzes
waltz	waltzes
Quartz	Quartzes
fuzz	fuzzes

Note: In some cases, some singular nouns end in –iz, double the –z to make their plural forms. For example, biz (bizzes), quiz (quizzes), whiz (whizzes).

- c. Making singular nouns ending in -f or -fe, by changing the -f to -v before adding suffix -s or -es.

Singular nouns end in -f or -ef	Plural due to inflection -s or -es
wife	wives
life	lives
knife	knives
thief	thieves
wolf	wolves
leaf	leaves

It should be noted here that the rule is generally accepted and there are exceptions to certain words (only the suffix -s is added without changing the last letter -f to -v) such as:

roof – roofs, belief – beliefs, chef – chefs, as well as chief – chiefs.

- d. Making singular nouns ending in -y plural by changing the -y into -i if the letter before the -y is a consonant before adding suffix -es.

Singular nouns end in a consonant + -y	Plural due to inflection -es
Baby	Babies
city	cities
theory	theories
lady	ladies
activity	activities
enemy	enemies

If the singular nouns end in -y but the letter before the -y is a vowel, the singular nouns are simply added by suffix -s to make them plural. For example: toy – toys, boy – boys, donkey – donkeys, essay – essays, day – days.

- e. Making singular nouns ending in -o plural by adding suffix -es.

Singular nouns end in -o	Plural due to inflection -es
Hero	Heroes
Potato	Potatoes
Buffalo	Buffaloes
mosquito	mosquitoes
mango	mangoes
tomato	tomatoes

an exception also occurs in this rule where words ending in -o only add a suffix -s with the following conditions:

- A singular noun ends in -o and the letter -o is preceded by a vowel such as: bamboo – bamboos, radio – radios, scenario – scenarios, studio – studios.
- A singular ends in -o, but is a foreign origin such as: casino – casinos, tango – tangos, dynamo – dynamos, alto- altos.
- A singular noun ends in -o, but is an abbreviation such as: kilo (kilogram) – kilos, photo (photograph) – photos, ngo (non-government organization) – ngos

Rules for irregular pluralization

- a. Making singular nouns end in -us plural by deleting the -us and adding -i

Singular nouns end in -us	Plural due to inflection -i
c actus	c acti
focus	foci
alumnus	alumni
octopus	octopi
nucleus	nuclei
r adius	r adii
Syllabus	Syllabi
stimulus	stimuli

- b. Making singular nouns end in -is plural, by deleting the -is and adding suffix -es

Singular nouns end in -is	Plural due to inflection -es
t hesis	t heses
analysis	analyses
axis	axes
c risis	c rises
Basis	Bases
diagnosis	diagnoses
Hypothesis	Hypotheses
Parenthesis	Parentheses

- c. Making singular nouns end in –on plural by deleting the –on and adding suffix –a

Singular nouns end in –on	Plural due to inflection –a
Phenomenon	Phenomena
c riterion	c riteria

- d. Making singular nouns end in –um plural by deleting the –m and adding suffix –a

Singular nouns end in –um	Plural due to inflection –a
c urriculum	c urricula
agendum	agenda
datum	data
minimum	minima
r eferendum	r eferenda
Bacterium	Bacteria
antenna	antennae
Amoeba	Amoebae
alga	algae

- e. Making singular nouns end in –e/ix plural by deleting the –e/ix and adding suffix –ices

Singular nouns end in –ex	Plural due to inflection –ices
appendix	appendices
matrix	matrices
c odex	c odices
Index	Indices

- f. Making singular nouns end in –a plural by adding suffix –e

Singular nouns end in –a	Plural due to inflection –e
formula	formulae
Vertebra	Vertebrae
l arva	l arvae

- g. Making singular nouns end in –ma plural by adding suffix –ta

Singular nouns end in –ma	Plural due to inflection –ta
dogma	dogmata
stigma	stigmata

- h. Making singular nouns end in –ouse plural by deleting the –use and adding suffix –ice

Singular nouns end in –ouse	Plural due to inflection –ice
mouse	mice
l ouse	l ice

some english nouns are pluralized without using any particular rules. Some of these nouns completely change in their plural forms but some do not. When we notice the plural forms of these nouns, we will see no suffix addition to the end of the nouns (uninflected). However, such kind of plural nouns are still recognized as inflection which in *The Farlex Grammar Book*, (2016), they are called irregular inflections. According to Mozias, T. (2019), the plural forms of these nouns have formed historically and simply need to be memorized. Here are the examples of such nouns.

Change irregular plural nouns		No change irregular plural nouns	
singular	Plural	singular	Plural
man	men	Barracks	Barracks
w oman	w omen	fish	fish
Person	People	deer	deer
c hild	c hildren	sheep	sheep
t ooth	t eeth	species	species
foot	feet	offspring	offspring
ox	oxen	means	means

4.1.2 Possessive case of nouns

Another type of noun inflection is possession which is also recognized as possessive case of nouns. Some English learners have difficulty distinguishing between possessive nouns and regular plural nouns due to the presence of

suffix –s at the end of nouns. Basically, possessive nouns are formed to show the expression of ownership. While plural nouns are formed to indicate that the number of a certain thing is more than one. Just like plural nouns, possessive nouns also have patterns that are commonly used in English. Before discussing several rules of establishing possessive nouns, it is very important to know that a noun in the pattern of possessive noun functions as an adjective. Syntactically, the word is still a noun but has the capacity as an adjective. After going through the inflection process (an apostrophe and suffix –s are added to the end of the noun), the addition then provides ownership information about the noun. For example, a noun ‘car’ is used together with a proper name (name of a person) e.g. ‘Elly’. Next, the word ‘Elly’ is placed in front of the phrase due to its capacity as an adjective which forms a phrase ‘Elly car’. The word ‘Elly’ is then added an apostrophe and suffix –s that it becomes ‘Elly’s car’ in which, Elly’s provides detailed information that the car belongs to a girl named Elly. In this case, Elly’s is acting as a modifier.

Inflectional Rules for Possessive Case of Nouns

To know more about how the inflection of nouns takes place in the area of possessive case of nouns, let’s take a look at the following five general rules.

a. Making the possessive case of singular nouns

for most singular nouns which do not end in –s, the possessive case of such nouns is formed by adding an apostrophe and suffix –s to the end of the nouns. Here are the examples:

- John cleans **his rabbit’s** cage every Sunday
- Anna drove **her mother’s** car yesterday
- They will buy **Mr. Akbar’s** house next week

In addition, the same rule is also applied for acronyms which are used as nouns such as tV, cctV, Vcd etc. for example, the cctV’s picture quality. In English however, we often find several singular nouns that end in letter -s. If we find such nouns, forming the possessive case can then be done in two ways and we can choose one of the two ways namely to add apostrophe and suffix -s or just to add apostrophe to the end of the nouns. The one we choose is usually determined by how comfortable we are with the pronunciation of the nouns. It means that we can choose the

most comfortable pattern according to our pronunciation, and the most importantly, the pronunciations of the nouns do not sound awkward and weird. For example, ‘Mr. James’ wife’ might sound better to pronounce than ‘Mr. James’s wife’ however that’s just a matter of my personal opinion.

b. Making the possessive case of plural nouns

making the possessive case of plural nouns is slightly different from making the possessive case of singular nouns. for plural nouns, we do not need to add an extra suffix –s to the end of the plural nouns because they already end in letter –s, all we need to do is simply to add an apostrophe onto the end of the nouns to show that the plural nouns have changed into plural possessive nouns. Let’s take a look at the following examples:

- we need to paint these **rooms’ walls** every three months.
- the head master invited **the students’ parents** to attend the graduation ceremony last week.
- my **sisters’ children** are playing in the garden.

However, if we find some English words which are plural but do not end in suffix –s (a plural marker for nouns in general) such as ‘children’ and ‘people’ (also known as irregular plural nouns), such plural nouns are simply given the rule for making the possessive case of singular that is to add an apostrophe and suffix –s at the end of them. For example:

- the man is kicking **the children’s ball**.
- I borrowed **the people’s money**.
- we like **the women’s handbags**.

c. Making the possessive case of compound nouns

A compound noun is a noun which is usually made by combining two or more words such as combining a noun and a noun (school bus), combining an adjective and a noun (beautiful girl) etc. it is important to note here that although a compound noun is shaped by combining two or more words, it still acts as a single word which is modified by an adjective or a noun as a modifier. In English, there are three kinds of compound nouns, among other things:

- closed or solid compound nouns (no space or hyphen is used between words e.g. software, football)
- Open compound nouns (space is used between words e.g. bus stop)
- Hyphenated compound nouns (hyphen is used between words e.g. father-in-law).

If we want to make the possessive case of such compound nouns, we should add an apostrophe and suffix –s (the compound nouns do not end in –s due to singular noun or irregular plural noun) or add an apostrophe without suffix –s (the compound nouns end in –s due to plural noun or letter –s at the end of the nouns). for example:

- my **mother-in-law's recipe** for fried chicken is my wife's favorite.
- He was very happy to see his **grand children's performance**.

d. Making the possessive case of multiple nouns with sharing ownership

In communicating either verbally or in writing, we sometimes want to convey about two people, two objects or more sharing the same ownership on a particular object. In this case, we only need to give the possessive marker to the last noun of the noun group. If the last noun does not end in letter -s, then to show ownership, we should add an apostrophe and suffix –s. However, if the last noun ends in letter -s, then an apostrophe is added without suffix -s. Here are the examples:

- **Tom and Jerry's songs** are very entertaining (tom and Jerry are singers and have the same song to sing).
- **My son and his daughter's school** is not very far from here. (my son and his daughter study at the same school).
- the Joker is **Batman and Robin's enemy**. (Batman and Robin have the same enemy).

e. Making the possessive case of multiple nouns with separate ownership

In addition, sometimes we also want to mention a possessive case of two or more nouns, but ownership of the nouns is separate. The rule commonly used to form such a possessive case is to add an apostrophe and suffix –s to each noun to indicate separate ownership. To clarify the understanding of such a possessive case, consider the following examples:

- **Adam's and Hawa's** rooms are painted white and pink (each individual has his or her own room and the rooms are different).
- You will see well-equipped kitchens in **Elly's and Nita's houses**. (each woman has her own house).
- **Mr. Soekarno's and Mr. Prabowo's speeches** are impassioned. (Each owns his speech, but they deliver separate speeches).

4.2 Inflection of adjectives

Just like nouns in English, adjectives can also undergo a change of form grammatically through the process of inflection. Inflection that occurs in adjectives is usually used to express grammatical function of comparison. In comparing an object with another, native English speakers commonly use three different degrees of comparison. They are positive, comparative, as well as superlative form of comparison. However, inflections on adjectives only occur in comparative and superlative form of comparisons. Nevertheless, it is worthwhile to discuss this section while still discussing these three forms to provide a detailed explanation of grammar about comparisons in English.

a. The positive form of comparison

An adjective is said to have a positive form if the adjective modifies a noun, but the adjective does not indicate the quality degree of its modification of the noun (a base form). For example, when we say “this bus is old”, the word ‘old’ is an adjective that modifies the noun ‘bus’ but the modification does not indicate the quality degree. This modification only means that when compared to other buses in general, this bus is old.

b. The comparative form of comparison

An adjective is called having a comparative function if the adjective modifies a noun and the modification shows that the noun has more degree of quality than another noun. To show the grammatical function of comparative form, a positive adjective is generally added to a suffix –er. The addition of the suffix –er to the adjective intended to convey the grammatical function of the comparative form, is hereinafter referred to as a form of inflection of adjectives. Here are some examples of comparative form of comparison:

- John is **strong-er** than me.
- This is a **rich-er** businessman than those ones.
- Adam runs **fast-er** than you

c. The superlative form of comparison

In addition, an adjective is said to have a superlative comparison function if the adjective modifies a noun and the modification indicates the highest quality in the noun. To realize this function, an adjective must undergo an inflection process that is usually done by adding suffix **-est** to the adjective. After going through the inflection process (adding the **-est** suffix to an adjective), the adjective then undergoes a change of grammatical function to express ‘the highest degree’ in the grammar of comparison which is here known as the superlative form comparison. The following examples illustrate how inflection takes place in the superlative form of comparison.

- Emily’s house is the **large-st** one in her neighborhood.
- That is the **small-est** car I’ve ever seen.
- All students threw their rocks at the same time. Adam’s rock flew the **high-est**.

Related to the process of inflection on adjectives especially to form the function of the comparison of higher degree and highest degree in English, there are some rules that should be applied, among others:

- The inflection of higher degree comparison (adding the **-er** suffix) and highest degree of comparison (adding the **-est** suffix) only take place in adjectives of one or two syllables. If an adjective has more than two syllables, degree of comparison grammar is formed by adding the word ‘more’ or ‘less’ before the adjective to express higher degree of comparison (comparative form) and adding the word ‘most’ or ‘least’ before the adjective to indicate highest degree of comparison (superlative form).
- For adjectives of one or two syllables, when the adjectives end in silent **-e** (an ‘**e**’ at the end of an adjective that is not pronounced), the silent **-e** should be dropped before adding suffix **-er** to show comparative form and adding suffix **-est** to show superlative form. Here are the examples:

No	Adjectives of one or two syllables	Comparative form	Superlative form
1	Wise (one syllable)	wiser	wisest
2	Large (one syllable)	larger	largest
3	Handsome (two syllables: hand-some)	Handsome	Handsomest
4	Gentle (two syllables: gen-tle)	gentler	gentlest

as the other rules do, this one also has some exceptions. as an example, the word ‘active’ has two syllables (ac-tive). When native English speakers use the comparative or the superlative form of this adjective, they tend to disobey the rule and prefer to use ‘more active’ instead of ‘activer’ and ‘the most active’ instead of ‘activest’.

- c. In English, there are adjectives of one or two syllables ending in y. Such adjectives undergo a process of inflection by substituting –y for –i before the adjectives are given the suffix –er to express the comparison of higher degree or given the suffix –est to express the comparison of highest degree. Here are the examples:

No	Adjectives ending in –y	Comparative form	Superlative form
1	Dry (one syllable)	drier	driest
2	Spry (one syllable)	sprier	spriest
3	Happy (two syllables: hap-py)	Happier	Happiest
4	Lazy (two syllables: la-zy)	lazier	laziest

- d. Many adjectives of single syllable have a short vowel and end in a single consonant. Such adjectives must be inflected by doubling the final consonant before adding suffix –er (comparative form) or adding suffix –est (superlative form). take a look at the following examples:

No	Adjectives ending in a vowel + a consonant	Comparative	Superlative
1	Big (one syllable)	Bigger	Biggest
2	Hot (one syllable)	Hotter	Hottest
3	Dim (one syllable)	dimmer	dimmest
4	Sad (one syllable)	sadder	saddest

although the rules of forming comparative degree exist in English, not all comparative and superlative forms are expressed by applying the rules as explained earlier in which the comparative forms of both comparative and superlative degree are done by adding the suffix –er, -est, or adding prefix –more, -most. A few adjectives are used to express the function of the comparative form by not following the rules for inflection of adjectives (the adjectives are uninflected), but simply use different forms of adjectives. Such kind of comparative forms are recognized as irregular inflection (*The Farlex Grammar Book*, 2016). In this regard, the irregular forms of the adjectives have historically been formed and used by native speakers of English. All we need to do with the forms is to memorize and to use them as well. The irregular adjectives are shown as follows:

No	Positive	Comparative	Superlative
1	many	more	the most
2	much	more	the most
3	good	Better	The best
4	Bad	worse	the worst
5	little (amount)	less	the least
6	old (people in a family)	elder	the eldest
7	well (healthy)	Better	The best
8	far (distance)	farther	the farthest
9	far (extent)	further	the furthest
10	less	lesser	the least
11	Ill	worse	the worst
12	Badly	worse	the worst

4.3 Inflection of verbs

Inflection of verbs refers to the process of adding inflectional morpheme (e.g. suffixes) to verbs which is aimed at modifying the verbs' tense, aspect and voice. In order to understand this section clearly, it is essential to describe what tense, aspect and voice are.

4.3.1 Tense: inflection of verbs

When we talk about tense, we can put the discussion into two different perspectives namely the perspective of period and the perspective of morphology. From the perspective of period, people view tenses by referring to the time of a particular action taking place. They are all about actions taking place according to certain duration of time. If people use this perspective to define tenses, they will say that there are three tenses in English which correspond to the present, the past, as well as the future. The reason is simple that people in reality generally talk about their activities which refer to these times. For example:

- we came here yesterday (the past)
- we come here today (the present)
- we will come here tomorrow (the future)

So, relating tenses to time will take us to a conclusion that there are three tenses in English. This perspective is commonly used by most grammarians to describe English tenses. In addition, from the perspective of morphology, people look at tenses by referring to the forms of English verbs. English only has two forms of verbs used to indicate a certain grammatical category which is marked by verb inflection namely the present and past verbs. There are no specific inflected verbs used to indicate the future. For example:

- She learns linguistics (learns is a present verb: an inflection)
- We learned linguistics (learned is a past verb: an inflection)

To talk about the future action, English simply needs either the auxiliary such as modal 'will' or be as in the present progressive 'be going to' and the verbs used are not inflected at all. For example:

- We will learn linguistics (learn is uninflected)
- We are going to learn linguistics (learn is uninflected)

Looking at the examples, we can clearly see that to express the future action, a present verb is used without involving any inflection of the verb at all. Since the expression of future action does not use inflection of verb that the future tense is morphologically considered not available in English. Furthermore, this perspective views that English just has two tenses i.e. the present and the past. Therefore, when we discuss the inflection of verbs, then we directly discuss about tense by using the perspective of morphology, which consists of the present and the past tense where inflection of verbs occur without being marked by auxiliaries. The inflection of verbs in both tenses is discussed as follows:

a. Inflection of verbs: simple present tense

The default of inflection of verbs in present tense can be seen in simple present tense. this tense generally has two main uses i.e. to express an ongoing event or action which regularly occurs in present time (for example ‘The baby falls asleep easily’. The verb ‘falls asleep’ is an ongoing action that the baby easily does) and to state an action that is happening right now (For example ‘Anita loves you’. The verb ‘loves’ indicates an action that is happening when the speaker is saying it). a sentence in simple present tense is constructed by using the root form of a verb or by inflecting the verb depending on the person used in the sentence. The basic rules for constructing sentences of simple present tense in English are:

Simple Present		Number	
		Singular	Plural
Person	first	I + root of verb	We + root of verb
	second	You + root of verb	You + root of verb
	third	She /He /it + inflection of verb (s/es)	They + root of verb

first-person singular: I eat (root)

second-person singular: You eat (root)

third-person singular: He/she/it eats (inflection: root+s)

first-person plural: we eat (root)

second-person plural: You eat (root)

third-person plural: they eat (root)

referring to the rules, it is clearly seen that most sentences use the root form of verbs, except those in the third-person singular use inflected verbs (suffix **-s** is added to the end of the verbs). In short, inflection of verbs only occurs in the sentences using third-person singular which is done by adding the suffix **-s** or **-es** to the end of the root of verbs. However, not all verbs in this case get suffix **-s** addition. A few verbs must be added by suffix **-es** instead of suffix **-s** when , the verbs typically end in one of the following letters:

- **o**(go-goes) mary goes to her grandmother’s house every sunday
- **ch**(teach-teaches) mr. James teaches e nGLISH in my school
- **sh** (wash-washes) my sister often washes the dishes after having lunch
- **x** (fix-fixes)He fixes old computers
- **ss** (discuss-discusses)Anita never discusses her personal problem with me
- **z** (buzz-buzzes) The bee buzzes when flying
- **a consonant + y : change y to I** (cry-cries) she cries easily

b. Inflection of verbs: simple past tense

On the other hand, the default of inflection of verbs in past tense can be seen in simple past tense. t he simple past tense is commonly expressed when people want to talk about actions or things that happened or existed before the present time. As an example, imagine that you ask your sister about what she bought when she was at the market yesterday.

You : What did you buy at the market yesterday?

Sister : I bought some fruits and vegetables.

the general rules for constructing sentences in the form of the simple past tense in e nGLISH are as follows:

Simple Past		Number	
		Singular	Plural
Person	first	I + root + ed/d (inflection)	w e + root + ed/d (inflection)
	second	You + root + ed/d (inflection)	You + root + ed/d (inflection)
	t hird	she /He /it + root + ed/d (inflection)	t hey + root + ed/d (inflection)

According to the rules, For sentences of the simple past tense, all subjects either singular or plural person use inflectional verbs in which the suffix –ed is generally added to the base form of verbs (roots). However, there are some rules to consider, among other things:

- If a verb used already ends in the letter -e, then the inflection is simply done by adding the suffix–d (type + d = typed)
- If a verb ends in a consonant and there is a vowel before the consonant, the last consonant of a verb must be doubled before adding the suffix –ed (plan + n + ed = planned). However, an exception is given to these verbs such as visit = visited, listen = listened, happen = happened, open = opened.
- If a verb ends in a letter –y and there is a consonant before, the letter –y must be changed to letter –i before adding the suffix –ed to the end of the verb (cry: cri + ed = cried).

Besides, it is also important to notice that the rules are specifically applied for regular verbs. Regular verbs refer to base form of verbs (plain forms of verbs as appear in the dictionary) that follow a regular pattern of inflection when constructing sentences of the past tense or the perfect tense such as adding the suffix–d or–edto the end of the verbs.

First-person singular:I worked in this company (work + ed = worked: inflection)

Second-person singular:You believed in ghost (believe + d = believed: inflection)

Third-person singular:He/shetriedto buy a new car (try + ed = tried:infection)

First-person plural:We stopped to help our teacher (stop + p + ed = stopped: inflection)

Second-person plural:You used calculators (use + d = used: inflection)

Third-person plural:They watched cartoons last night (watch + ed = watched: inflection)

In addition to regular verbs, English also uses irregular verbs. Irregular verbs refer to verbs that do not follow the pattern of inflection (suffix addition to the end of verbs) as taken place in regular ones when forming the past tense for instance. To use irregular verbs in simple past tense, we need to use

their own patterns for past verbs which have certainly no predictable forms and we may not add any suffixes to the end of the verbs as regular verbs do (Nordquist, R 2019). Let us take the verb 'eat' as an example. We may not turn, 'I eat Pizza every morning' into 'I ate pizza yesterday morning' because the word 'eat' does not belong to regular verbs. It belongs to irregular verbs which has its own past form that is 'ate'. So, the past form of 'I eat pizza every morning' is 'I ate pizza yesterday morning'. Some forms of the irregular verbs are:

No	Present form (base)	Past form	Past participle form
1	Break	Broke	Broken
2	cut	cut	cut
3	come	came	come
4	speak	spoke	spoken
5	go	went	gone

To facilitate EFL learners distinguish between regular and irregular verbs, they are suggested to use Dictionaries because a good dictionary always gives clear information on regular and irregular verbs. Even, some good dictionaries provide pages where learners can see and learn the list of irregular verbs.

4.3.2 Aspect: inflection of verbs

Another grammatical category which could represent the inflection of verbs is aspect. As the matter of fact, many grammarians are of the opinion that aspect is an integral part of tense. Some even consider that aspect is a tense's subcategories. Therefore, aspect in this section may be defined as the duration of an action in a particular tense. In other words, aspect of a tense provides information regarding how an action occurs within a particular period of time. English has four types of aspects i.e. simple, progressive, perfect as well as past progressive. All the aspects exist in both present and past tense. To understand this, take a look the following figure:

Tenses	Aspects	Examples in sentences
Present	simple present	I wash my car (the default of present tense)
	Present progressive	I am washing my car
	Present perfect	I have washed my car
	Present perfect progressive	I have been washing my car
Past	simple past	I washed my car (the default of past tense)
	Past progressive	I was washing my car
	Past perfect	I had washed my car
	Past perfect progressive	I had been washing my car

If the examples are analyzed, we can clearly see that the inflection of verbs takes place with the presence of auxiliaries (e.g. am, was, have, had) before the inflected verbs (wash + ing = washing, wash + ed = washed). This fact has made tense and aspect different. In tense, inflection of verbs occurs without any auxiliaries, but aspect always needs auxiliaries to inflect verbs. In this regard, this section does not specifically discuss simple present tense and simple past tense because both aspects are the default of tenses which have already been discussed in the previous section. Therefore, the discussion regarding aspect specifically centers on progressive, perfect, and perfect progressive as the subcategories of both tenses.

a. Progressive Aspects: Present progressive and Past progressive

the progressive aspects are used to express ongoing or incomplete actions at a specific period of time in the present or in the past. When an action is a continuing action or is going on by the time a speaker is speaking, it is the present progressive aspect. for example ‘John is working’, this sentence indicates that John started sleeping in the past and is still sleeping in the present, and perhaps john will still continue sleeping. In the other side, the present progressive can also be used to indicate that an event is going to happen in the future if the event is a planned event. the rules for forming the present progressive as follows:

Present progressive		Number	
		Singular	Plural
Person	first	I + am + verb + ing (inflection)	We + are + verb + ing (inflection)
	second	You + are + verb + ing (inflection)	You + are + verb + ing (inflection)
	third	She /He /it + is + verb + ing (inflection)	They + are + verb + ing (inflection)

Falling back to the rules, the present progressive is formed with the helping of auxiliary (to be in the present form: am, is, are) plus an inflected verb which is here called as the present participle of verb (a verb with an –ing ending), for example:

- They are working through the holiday break (an ongoing action).
- I am arriving in two hours (a future planned action).

on the other hand, when an action was taking place or going on at some point in the past, it is the past progressive aspect. for example, ‘elli was reading a novel all day long yesterday’. the sentence indicates an ongoing action that elli did all day long yesterday (the past time). In addition, the past progressive is also used to express that an event happened while another event was taking place. the rules forming the past progressive as follows:

Past progressive		Number	
		Singular	Plural
Person	first	I + was + verb + ing (inflection)	We + were + verb + ing (inflection)
	second	You + were + verb + ing (inflection)	You + were + verb + ing (inflection)
	third	She /He /it + was + verb + ing (inflection)	They + were + verb + ing (inflection)

The rules above indicate that the past progressive is also formed with the help of auxiliary (to be in the past form: was, were) plus an inflected verb known as present participle of verb (with suffix –ing), for example:

- I was sleeping in my room when you came (an ongoing action in the past).
- Jane lost her bracelet while she was swimming(an event took place while another event was happening).

In order to form present participle appropriately, it is essential to know the spelling rules as follows:

- When a verb ends in a consonant, but there is a vowel before the consonant, the final consonant must be doubled before being inflected by adding suffix –ing. For example; run + n + ing = running, sit + t + ing = sitting, beg + g + ing = begging, admit + t = admitting.
- When a verb ends in final –ic, the verb is inflected by adding letter –k plus suffix –ing. For example, mimic + k + ing = mimicking, panic + k + ing = panicking, picnic + k + ing = picnicking.
- When a verb ends in a silent –e, the silent –e must be dropped and then suffix –ing is added. For example: move + ing = moving, close + ing = closing, invite + ing = inviting.
- When a verb ends in –ie, the final –ie must be changed to –y before adding suffix –ing. For example: lie + ing = lying, die + ing dying.

b. Perfect Aspects: Present perfect and Past perfect

In English, perfect aspects are commonly used to indicate a perfected or finished action occurring in the present or in the past without telling an indefinite time. When a speaker in the present time is stating that an event is finished, so the present perfect aspect would be used. This aspect is formed by using the following rules:

Present perfect		Number	
		Singular	Plural
Person	first	I + have + root + ed/d (inflection)	we + have + root + ed/d (inflection)
	second	You + have + root + ed/d (inflection)	You + have + root + ed/d (inflection)
	third	she /He /it + has + root + ed/d (inflection)	they + have + root + ed/d (inflection)

Specifically, the present perfect is used to express that an even was finished at some time ago in the past or to express an action which begins in the past and still extends to the present, for example:

- She has walked three miles (She began walking in the past and is still walking now)
- I have written a letter (I finished writing a letter some time ago in the past)

Besides, when the speaker stated that the event was perfected in the past once or many times before another event took place, past perfect aspect would be used, the following rules are commonly used to form this aspect:

Past perfect		Number	
		Singular	Plural
Person	first	I + had + root + ed/d (inflection)	we + had + root + ed/d (inflection)
	second	You + had + root + ed/d (inflection)	You + had + root + ed/d (inflection)
	third	she /He /it + had + root + ed/d (inflection)	they + had + root + ed/d (inflection)

The examples can be seen in the following sentences:

- I had studied English for three years before I moved to USA
- Adam knew Jakarta very well because he had visited the city many times.

the rules indicated that present perfect and past perfect aspect are created by using auxiliary verbs (helping verbs) such as: have (I, you, we, and they) and has (she, he, and it) for the present perfect, and had (all types of subjects) for past perfect followed by inflected verbs (adding the suffix –ed/-d). The inflected verbs used in the perfect aspects are called past participle verbs. According to Nordquist, R (2019), past participle is the third principal part of a verb which may be created in two ways namely: the first, when a verb belongs to regular verbs, the past participle is commonly created by adding suffix –ed (work + ed = worked), or -d (cite + d = cited) to the root form of the verb. The rules of inflection (adding suffix –ed) to form past participle are the same as the ones of the simple past tense. Therefore, it is much easier to understand past participle when EFL learners know how to make verbs of past tense. The second, when a verb belongs to irregular verbs, all the EFL learners need to do is to use their own patterns for past participle verbs. It is really suggested that EFL learners view the patterns of irregular verbs for past participle on special pages commonly available in good dictionaries. This can be very helpful in understanding how they are formed (Nordquist, R 2019). Here are some examples of past participle verbs of irregular verbs:

No	Present form (base)	Past form	Past participle form
1	do	did	done
2	w rite	w rote	w ritten
3	drive	drove	driven
4	see	saw	seen
5	l ose	l ost	l ost

Here are the examples of the verbs' usage in sentences:

- I had done the dishes before they ate last night.
- Elli had known the life story of Mr. B.J. Habibie so well because she read his autobiography many times.
- My father had driven the car for six years before it finally broke down.
- We had never seen a ghost before last night.
- Anita did not have any money at all yesterday because she had lost her wallet the day before.

c. Perfect Progressive Aspects: Present perfect progressive and Past perfect progressive

the perfect progressive aspects are normally used for expressing an event which began in the past and extended either to a specific time in the past or to the present time. when the event started in the past and has continued up to the present, the present perfect progressive aspect would be used. The formulas for forming the present perfect progressive are:

Present perfect progressive		Number	
		Singular	Plural
Person	first	I + have + been + root + ing (inflection)	We + have + been + root + ing (inflection)
	second	You + have + been + root + ing (inflection)	You + have + been + root + ing (inflection)
	third	She /He /it + has + been + root + ing (inflection)	They + have + been + root + ing (inflection)

the examples in sentences:

- My parents have been talking to your parents for over one hour
- I have been teaching English for the last fifteen years
- We have been waiting here for fifteen minutes

In addition, when an event began in the past and continued up to a specific time in the past, the past perfect progressive aspect would be used. Here are the rules used for forming the aspect:

Present perfect progressive		Number	
		Singular	Plural
Person	first	I + had + been + root + ing (inflection)	We + had + been + root + ing (inflection)
	second	You + had + been + root + ing (inflection)	You + had + been + root + ing (inflection)
	third	She /He /it + had + been + root + ing (inflection)	They + had + been + root + ing (inflection)

the rules' examples in sentences:

- The teachers had been talking for 30 minutes before the principal arrived.
- He had been working at the company before it closed down last year.
- I wanted to sit down because I had been standing for about three hours.

according to the rules, present perfect progressive and past perfect progressive aspect are constructed by using auxiliary verbs (helping verbs) such as: have (I, you, we, and they) and has (she, he, and it) for the present perfect, and had (all types of subjects) for past perfect followed by been (past participle of be) and inflected verbs (adding the suffix –ing) which are also recognized as present participle verbs. The rules for inflecting the roots (adding suffix –ing) to form present participle verbs are the same as the spelling rules of present participle as described earlier.

4.3.3 Passive Voice: inflection of verbs

The relationship between a subject and an object in a sentence can be expressed in two ways. The ways of expressing the relationship between a subject and an object are known as voice. Therefore, we recognize two voices in English. They are active and passive voice. Active voice is the most sentences in English. It refers to a type of clause or sentence in which the subject performs the verb's action and the direct object receives the action of the verb. For example: "Adam eats three hamburgers every morning". This sentence is an active sentence because Adam (subject) is doing the eating (the

verb) and three hamburgers (object) are receiving the action of eating. On the other hand, passive voice refers to a type of a clause or sentence in which an object is more emphasized than its subject and the subject receives the action of the verb with the help of preposition -by or occasionally the subject is not mention at all. For example: “three hamburgers are eaten by Adam every morning”. This is a passive sentence because three hamburgers (the objects) are more emphasized and the subject (no longer active) receives the action of eaten (verb) with the help of –by (preposition). Inflection of verbs in active voice has been described in the subsections of tenses and aspects. Hence, this subsection specifically discusses the inflection of verbs in passive voice. Let’s take a look at some of the passive formulas using regular and irregular verbs.

Tenses/ Aspects	Subject (s)	Auxiliary		Inflection of verbs (past participle)	
		Singular	Plural	Regular	Irregular
simple present	t he class	is		dismissed	
Present progressive	new roads		are being	c onstructed	
Present perfect	His computer	has been			stolen
simple past	this article	was			written
Past progressive	t he walls		were being	Painted	
Past perfect	t heir house	had been		Improved	
simple future	t he meetings		will be		Held

If we notice the passive formulas, the passive sentences are formed by combining auxiliaries (for example: to be and modals) and inflection of verbs (past participle). In passive voice, inflection of verbs is taking place due to the use of past participle verbs in which all verbs in passive sentences are inflected by adding suffix –ed/d at the end of the verbs when they belong to regular verbs. However, when the verbs belong to irregular verbs, we simply need to use verbs own past participle forms which already been listed in the irregular verbs’ list of English.

5. Word Formations: Productive and Less productive word formation

As stated earlier that word formation may be defined as a process of forming words by using morphemes that has an impact on not only changing meaning, but also changing part of speech (word class). In this regard, Becker, a., & Bieswanger, m. (2004) categorized word formation into two types, namely productive word formation and less productive word formation. Both types are going to be discussed to describe word formation issues in English.

5.1 Productive word formation

Productive word formations refer to the processes of forming words which are frequently used to create new words in a language (Plag, I. 2018). Productive word formations include compounding and derivation.

5.1.1 Compounding

Compounding may be understood as a process of creating words by combining two or more free morphemes. In this regard, Bauer, L. (1983) is of the opinion that compounding takes place when two or more stems (the root of a word) are combined to form another stem. If we take a closer look at both definitions, we will find out that the definitions at least contain two underlying assumptions, i.e. compounding consists of two or more components, and the second that these components must be free morphemes (stems). Plag, I. (2018) assumes that compounds in English may involve two, three, four, five or even more elements e.g. ‘communication technology equipment’ and ‘university teaching award committee member’. Compounding has several categories. The categories are established based on two different perspectives, i.e. semantical perspective and lexical perspective.

If we view compounding from semantical perspective, its categories fall into two categories namely; endocentric compound and exocentric compound. When we combine two or more elements (stems) to form another word and the meaning of the word is predictable after combining the meaning of its elements, the compound is then recognized as endocentric compound. for example, a linguistic book, the meaning of the word is predictable since we recognize it as a particular kind of book which contains information on linguistics. In addition, when we combine two free morphemes to form another word and the meaning of the word is unpredictable after combining the

meaning of its elements, the compound is then called exocentric compound. For instance, a word ‘blacklist’. The meaning of the word cannot be guessed. List is only defined as a printed record of short pieces of information, such as people’s names when it stands alone. A blacklist is then defined as a list of people or things that are considered as unacceptable or untrustworthy that should be avoided.

If we see compounding from syntactical perspective, its categories are included in compound noun, compound verb, compound adjective, and compound adverb (Bauer, L. 1983). These types of compounds are briefly discussed as follows:

a. Compound noun

In English, compound noun is also known as nominal compound. It may be defined as the process of constructing a single noun by combining two or more free morphemes. This type of compounding is generally endocentric and has three spelling rules i.e. it is written as separate words e.g. orange juice, as a string of words which are linked by hyphens e.g. mother-in-law, and as one word e.g. headphone. In addition, compound nouns may be formed by using diverse part of speech. Let’s take a look at the following examples:

No	Compound noun part of speech	Compound noun examples
1	noun + noun	- motorcycle - water tank - Bedroom
2	Verb + noun	- driving license - dining room - washing machine
3	Adjective + noun	- Soft file - greenhouse - redhead
4	Adverb + noun	- Bystander - onlooker
5	Noun + verb	- train-spotting - Haircut - rainfall
6	Noun + adverb	- Passer by - Hanger on

No	Compound noun part of speech	Compound noun examples
7	Verb + adverb	- take-off - Drawback - Lookout
8	Adjective + verb	- Public speaking - dry cleaning
9	Adverb + verb	- Input - output - Upturn

b. Compound verb

Generally, a compound verb is the process of making a single verb by combining two or more free morphemes, e.g. babysit. This verb is formed by combining two different free morphemes, i.e. morpheme ‘baby’ as a noun and morpheme ‘sit’ as a verb. The combination of both morphemes has formed another word that is ‘babysit’ which functions as a verb meaning to look after a child or children while the child’s or the children’s parents are out. Specifically, <https://grammar.yourdictionary.com> says compound verb has four forms including: a prepositional verb (adding a preposition), a phrasal verb (making a phrase), a verb with its auxiliary (adding a helping verb), single word verb (combining two words together). Let’s take a look at each of these forms in closer detail.

Prepositional Verb

This type of compound verb is made when a preposition is combined with a verb to form another verb. That is why, the resulting verb is then recognized as a prepositional verb. Here are the examples of prepositional verbs used in sentences.

- t hey **believe in** ghosts (believe in= believe: a verb + in: a preposition)
- my sister **asks for** more milk (ask for= ask: a verb + for: a preposition)
- t he success of this organization will **rely on** our leader (rely on= rely: a verb + on: a preposition).

Phrasal Verb

This type of compound verb is made by combining between a verb and an adverb or combining a verb and an adverb plus a preposition to form another verb. Some of the examples include:

- the students **take off** their shoes (take off= take: a verb + off: an adverb)
- You should **throw away** the garbage (throw away= throw: a verb + away: an adverb)
- Jane is too tired to **put up with** any nonsense (put up with= put: a verb + up: an adverb + with: a preposition).

Verb with Auxiliaries

This form is made by combining a verb with a helping verb called an auxiliary to form another verb. The types of auxiliaries commonly used in this form are modals, have, has, had, am, is, are, was, were, be, as well as been. Take a look at the following examples:

- Adam **is learning** English now (is learning= is: an auxiliary + learning: a verb)
- we **will meet** to discuss the issue next week (will meet= will: an auxiliary + meet: a verb)
- they **have seen** the car (have seen= have: an auxiliary + seen: a verb)

Single word verb

This type of compound verb is the most common one used in English among the types of compound verbs. It is formed by combining two or multiple free morphemes. Its spelling rule is conventionally written as either two hyphenated words, e.g. 'mass-produce' (to produce a product in large quantities by using an automated mechanical process) or one word, e.g. 'daydream' (to think about a pleasant thing for a certain period of time, usually about a thing that is really wanted to happen). Here are the examples in sentences:

- She always **bad-mouths** her husband (bad-mouth: to criticize someone or something in an unpleasant manner).
- Adam is **housesitting** now (housesit: to live in and to look after a house while its owner is away).

c. Compound adjective

A compound adjective is also recognized as a phrasal adjective. It is an adjective made up of two or more free morphemes, (e.g. well-known) commonly used for modifying a noun. For example, a well-known teacher. The compound adjective has several types, i.e. compound adjectives with numbers, compound adjectives with adjectives + past participles, compound adjectives with adverb + past participles, compound adjectives with adjectives + present participles, compound adjectives with adverbs + present participles, compound adjectives with nouns + present participles, compound adjectives with nouns + past participles, compound adjectives with nouns + adjective, compound adjectives with adjectives + nouns and other.

Compound adjectives : numbers

- Fifteen-minute break
They had a fifteen-minute break this afternoon
- two-hour
Anita and I will watch a two-hour Indian movie tonight
- one-day
The students are attending a one-day seminar
- nine-year-old
We have a nine-year-old daughter
- twelve-page
I have submitted a twelve-page article to an International journal.

Never use suffix –s at the end of words formed by compound adjectives with numbers. For example:

- an **eleven-weeks** course (incorrect)
- an **eleven-week** course (correct)

Compound adjectives : adjectives + past participles

- open-minded : willing to consider new ideas
Many young people today tend to be more open-minded.
- old-fashioned : not modern
John looks old-fashioned in his outlook.
- Bad-tempered : become angry or annoyed easily
My grand-mother was very bad tempered this morning.

- Long-awaited : having been expected for a long time
Dr. Kaharuddin has published his long-awaited research report.
- Simple-minded : no ability to use reason and understand
alex is a simple minded person

Compound adjectives : adverb + past participles

- well-educated : having had a good education
Many well-educated people have trouble finding good jobs.
- Highly-recommended : suggested as something suitable for a particular purpose
dr. e lli is a highly-recommended pediatrics.
- densely-populated : a lot of people live close together
makassar city is one of the most densely-populated cities in Indonesia.
- Well-known : recognized by many people
michael Jackson is a very well-known singer in the world.

Compound adjectives : adjectives + present participles

- good-looking : Physically attractive
all men love seeing a good-looking woman.
- long-lasting : continuing for a long period of time
We enjoy our long-lasting friendship.
- easy-going : relaxed and not easy upset
- I am an easy-going person
- Quick-thinking : having or showing an ability to think or react quickly and effectively
Citizens praised the quick-thinking firefighters who helped evacuate 39 children

Compound adjectives : adverbs + present participles

- never-ending : last a very long time
Political issues are never-ending in this country.
- forward-looking : favoring innovation and development; progressive
I work in a forward-looking company.

Compound adjectives : nouns + present participles

- Heart-breaking : causing intense sorrow or distress
We hear the heart-breaking news
- English-speaking : speaking English as a mother tongue
They are taught by an English-speaking teacher
- Time-consuming : taking a lot of or too much time
Writing a book is very time-consuming,

Compound adjectives : nouns + past participles

- Sun-baked : very dry, hot and receives a lot of sun
My sister and I strolled along the sun-baked streets in Bali
- Middle-aged : around 40 to 50 years old
They are middle-aged couple.

Compound adjectives : nouns + adjectives

- World-famous : known throughout the world.
Westlife's songs are world famous
- Ice-cold : very cold liquid
We don't like drinking ice-cold tea.
- Smoke-free : without smoke
This restaurant is smoke free.

Compound adjectives : adjectives+ noun

- Full-length : normal or standard length
Siti Nurbaya is a full-length novel
- Last-minute : done or occurring at the latest possible time before an event
The editor wanted to make last-minute changes to a publication.

Compound adjectives : adjectives+ adjective

- Dark-blue : a dark shade of blue
Elli is wearing a dark-blue uniform.
- Fat-free : not containing animal or vegetable fats
I like eating fat-free cookies.

Compound adjectives : noun+ noun

- water-proof : impervious to water
It is not a water-proof coat.
- Part-time : do something for only some of the day or the week
John is enrolled as a part-time student.

In this regard, compound adjective has a general rule for spelling. When a word formed by a compound adjective comes before a noun, the word must be hyphenated, e.g. ‘a water-proof coat’, but it is not hyphenated when it comes after the noun, e.g. ‘The coat is water proof’. Besides, a compound adjective with an adverb ending in –ly, e.g. ‘rapidly growing’ is usually not hyphenated.

d. Compound adverb

A compound adverb is also recognized as a compound modifier. It is formed by pairing two or more free morphemes that functions as an adverb. Sometimes, one adverb is combined with another adverb or occasionally with another different part of speech such as a noun, an adjective, a preposition, or a verb. In English sentences, the compound adverb is generally used for modifying a verb, an adjective, an adverb, or an entire clause. Here are some examples of compound adverbs:

No	Part of speech	Compound adverbs
1	Adverb + adverb	Further + more = furthermore How + ever = however
2	Adverb + noun	There + fore = therefore
3	Adverb + preposition	There + after = thereafter
4	determiner + noun	Some + time = sometime Any + time = anytime
5	Noun + adverb	Regard + less = regardless
6	Preposition + preposition	Inside + out = inside out

Compound adverbs are commonly written as one word, (e.g. *therefore*), but occasionally as one hyphenated word, (e.g. *self-consciously*), and sometimes as two words, (e.g. *inside out*).

5.1.2 Derivation

In linguistics, derivation is sometimes called as morphological derivation. It refers to the process of forming other words by adding prefixes or suffixes to existing words. For example, an existing word ‘happy’ may be used to form other words by adding a prefix –un (un + happy = unhappy) or adding s suffix –ness (happy + ness = happiness). Derivation of English are subdivided into two types, i.e. class-changing derivation and class-maintaining derivation. Class-changing derivation refers to the process of forming other words by adding prefixes or suffixes, in which the derivation not only changes the meaning, but also changes the word class of the existing words, e.g. an existing word ‘play’ is added a suffix –er to form another word ‘player’.

Root / Base	Meaning	Suffix	Derivation	Meaning
Play (verb)	engage in a sport or game.	-er	Player (noun)	a person taking part in a sport or game.

on the other hand, class-maintaining derivation refers to the process of forming other words by adding prefixes or suffixes, in which the derivation process does not change the word class of the existing word, but simply changes its meaning, e.g. an existing word ‘king’ is added by a suffix –dom to form another word ‘kingdom’.

Root / Base	Meaning	Suffix	Derivation	Meaning
king (noun)	the male ruler of an independent state, especially one who inherits the position by right of birth.	-dom	kingdom (noun)	a country, state, or territory ruled by a king or queen.

Both derivation’s subcategories are usually used to differentiate derivation to inflection. Derivation modifies words to form distinct word class (syntactical), meaning (semantical) or even both of them. However, inflection modifies words to form different grammatical categories without changing both word class and meaning. According to Sobin, N. (2010), English morphological derivation has several patterns namely: adjectives-to-nouns, adjectives-to-verbs, adjectives-to-adverbs, adjectives-to-adjectives, nouns-to-adjectives, nouns-to-verbs, nouns-to-nouns, verbs-to-adjectives, and verbs-to-nouns. The patterns are briefly explained as follows:

a. Adjectives-to-nouns

This pattern indicates that we can use adjectives to form nouns by adding suffixes such as –cy, -ity, and –ness. Take a look at the following examples:

Suffixes	Adjectives	Meanings	Nouns	Meanings
- cy	Efficient	achieving maximum results with minimum efforts or expenses.	Efficiency	quality of being efficient
	Urgent	requiring immediate attentions or actions.	Urgency	the quality of being very important and needing immediate attentions.
	frequent	occurring or done on many periods of times.	frequency	something repeatedly occurs over a particular period of time.
- ity	similar	having characteristics in common.	similarity	people or things look the same.
	Responsible	having an obligation to do something.	Responsibility	the state of having a duty to do something.
	c urious	eager to know something.	c uriosity	a strong desire to know something
- ness	Happy	feeling pleasure or contentment.	Happiness	a sense of pleasure or contentment.
	dark	little or no light.	darkness	the quality of being little or without light.
	c onscious	aware of and responding to surroundings.	consciousness	the state of realizing something.

b. Adjectives-to-verbs

This pattern indicates that we can also use adjectives to form verbs by adding suffixes such as –ise, -ate, -fy, and -en. Take a look at the following examples:

Suffixes	Adjectives	Meanings	Verbs	Meanings
- ize	Stable	not likely to move or change.	Stabilize	to make stable
	Visual	relating to sight.	Visualize	to make something visible to the eye.
	special	not ordinary or usual.	specialize	to concentrate on a particular skill or subject.
- ate	different	not the same as another.	differentiate	to make something different.
	liquid	flowing like water freely.	liquidate	to cause a business closed and sell its assets to pay its debts.
	simple	easily understood or done.	simplicate	to make a system more complex that the use of the system is easier or even simpler.
- fy	solid	firm in shape	solidify	make something become solid.
	Pure	not mixed with any other substances or materials.	Purify	to remove bad materials from something to make it pure.
	false	not according with the truth.	falsify	to make false.
- en	fast	capable of moving at high speed.	fasten	to cause something firmly fixed together.
	sharp	having an edge which is able to cut something.	sharpen	make something become sharp.
	short	a small distance from end to end.	shorten	to make something shorter.

c. Adjective-to-adverb

This pattern is used to change adjectives into adverbs by adding suffix -ly. Take a look at the following examples:

Suffix	Adjectives	Meanings	Adverbs	Meanings
-ly	easy	achieved without a great effort	easily	without difficulty or a great effort
	continuous	happening or without a break.	continuously	without interruptions.
	Polite	showing a respectful behavior and considerate of other people.	Politely	in a respectful and considerate way.

d. Adjectives-to-adjectives

This pattern enables us to use adjectives for forming other adjectives by adding suffix -ish, or adding prefixes such as un-, im-, in-, ir-, il-, non-, as well as dis-. Take a look at the following examples:

Suffix	Adjectives	Meanings	Other adjectives	Meanings
-ish	red	color next to orange and opposite violet.	reddish	slightly red.
	Yellow	color between green and orange.	Yellowish	slightly yellow.
	Blue	color intermediate between green and violet.	Bluish	slightly blue.

Prefixes	Adjectives	Meanings	Other adjectives	Meanings
Un-	Able	having a skill or an opportunity to do something.	Unable	lacking the skill or the opportunity to do something.
	ethical	relating to moral principles.	Unethical	morally incorrect
	Breakable	being broken easily.	Unbreakable	not to be broken easily.

Prefixes	Adjectives	Meanings	Other adjectives	Meanings
Im-	mature	full-grown physically	Immature	not fully grown.
	Patient	able to accept any problems without being annoyed.	Impatient	having a tendency to be annoyed due to a problem.
	Possible	able to be done.	Impossible	able to be done.
In-	inconvenient	giving someone personal comfort	Inconvenient	causing discomfort
	sane	not mentally ill.	Insane	mentally ill.
	Definite	clearly decided or stated.	Indefinite	not clearly decided or stated.
Ir-	irregular	capable of moving at high speed.	Irregular	to cause something firmly fixed together.
	Responsible	having an obligation to do something.	Irresponsible	not showing responsibility.
	irrational	based on reason and logic.	Irrational	not reasonable.
Il-	illegal	based on the law	Illegal	contrary to the law.
	illiterate	able to write and to read.	Illiterate	unable to write and to read.
	illustrious	shining	Illustrious	respected past achievement.
dis-	disloyal	giving constant support	disloyal	not giving loyalty.
	Satisfied	feeling pleased	Dissatisfied	feeling unhappy with something.
	Honest	free of untruthfulness.	dishonest	behave in an untrustworthy manner.

e. Nouns-to-adjectives

This pattern enables us to use nouns for forming other adjectives by adding suffix –al, -ous, -ful, and –less. Take a look at the following examples:

Suffixes	Nouns	Meanings	Adjectives	Meanings
- al	nation	a particular country.	national	relating to a particular country.
	option	a thing that is chosen.	optional	may be chosen or not.
	Profession	a paid job.	Professional	relating to a profession.
-ous	danger	the possibility of coming to harm.	dangerous	able to cause harm.
	tendency	an inclination toward a type of behavior.	tendentious	intending to promote a controversial point of view.
	Ambition	a strong desire to do something.	Ambitious	showing a strong desire to achieve something.
- ful	fruit	the product of a tree.	fruitful	producing much fruit or good results.
	Joy	feeling great happiness.	Joyful	causing great happiness.
	Peace	freedom from disturbance or war.	Peaceful	without disturbance or violence.
- less	Home	the place to live permanently.	Homeless	a person without a home to live.
	speech	the expression of thoughts and feelings by articulating sounds.	speechless	unable to speak.
	care	giving serious attention to be able to do something correctly.	careless	not giving serious attention.

f. Nouns-to-verbs

This pattern enables us to use nouns for forming other verbs by adding suffix –fy. Take a look at the following examples:

Suffix	Nouns	Meanings	Other verbs	Meanings
- fy	c lass	a set of categories of things.	c lassify	arrange a group of people or things in categories according to their characteristics.
	glory	honor achieved by great achievements.	glorify	t he act of worshipping (e.g. god).
	e xample	a pattern to be imitated.	e xemplify	to show by examples.

g. Nouns-to-nouns

This pattern enables us to use nouns for forming other nouns by commonly adding prefixes (such as anti-, auto-, co-, counter-, inter-, mal-, mono-, neo-, re-, semi-, sub-, super-, under-). Take a look at the following examples:

Prefixes	Nouns	Meanings	Other nouns	Meanings
anti-	c limax	the most exciting point of an event.	anticlimax	a disappointing end to an exciting event.
	t hesis	a statement that is put forward as a premise.	antithesis	a contrast between two things.
auto-	Biography	the story of someone's life written by someone else.	Autobiography	the story of a person's life written by that person himself.
	c ritic	an unfavorable opinion of something.	auto critic	self-criticism

Prefixes	Nouns	Meanings	Other nouns	Meanings
c o-	w riter	a person who writes a particular text.	c o-writer	a person who has written a particular text together with another person.
	founder	a person who has established something e.g. a company.	c o-founder	a person who has established something together with another person.
c ounter-	argument	reasons given with the aim of persuading others.	c ounter-argument	a set of reasons given to oppose an idea developed in another argument.
	e xample	a person or a thing regarded to be imitated.	c ounter-example	an example given with the aim of contradicting an idea.
e x-	c hairman	a person designated to organize a group.	e x-chairman	a former chairman
	Hunter	a person who hunts animals for food or for hobbies.	e x-hunter	a former hunter
Hyper-	t ext	a piece of written material.	Hypertext	chunk of text that can be linked to another text.
	Inflation	increasing in prices and falling in the value of money.	Hyperinflation	monetary inflation increasing at a very high rate.
In-	attention	focus given on a selected stimulus.	Inattention	lack of attention.

Prefixes	Nouns	Meanings	Other nouns	Meanings
	coherence	the state of being consistent and logical.	Incoherence	the state of being inconsistent and illogical (unclear).
Inter	action	process of doing something.	Interaction	reciprocal action.
	language	the method used by humans to communicate.	Inter-language	a type of language used by the learners of foreign or second language.
mal-	function	an activity intended for a person or thing.	malfunction	fail to function satisfactorily
	nutrition	providing the food important for health and growth	malnutrition	lack of good nutrition due to not having enough to eat.
mis-	conduct	the way someone behaves.	misconduct	a person's unacceptable behavior.
	management	activities for controlling things or people.	mismanagement	managing something wrongly.
mini-	market	an area where people regularly gather for the purchase and sale.	mini-market	a small store which sells goods.
	theory	a system of ideas used to explain something scientifically.	mini-theory	the root of ideas by constructed by a grand theory.

Prefixes	Nouns	Meanings	Other nouns	Meanings
mono-	Syllable	a unit of pronunciation containing one vowel sound.	Monosyllable	a word having one syllable only.
	graph	a diagram that shows the relation between variables	monograph	a single specialized subject of a study which is written in detail.
neo	colonialism	the practice of political control over another country.	neo-colonialism	the use of political cultural, economic to control over other countries.
	Imperialism	extending the power of a country using military force.	neo-imperialism	using globalization, capitalism, as well as cultural to influence developing countries.
re-	organization	the process of organizing something.	re-organization	the process of changing the way something is organized.
	examination	testing the knowledge of a person in a particular subject formally.	re-examination	the process of examining something again.
semi-	circle	a round plane figure	semicircle	a half of a circle
	trailer	a container on wheels that is pulled by a car	semitrailer	a large container with wheels at the back which is pulled along by a truck

Prefixes	Nouns	Meanings	Other nouns	Meanings
Sub-	title	the name of written works.	Sub-title	a subordinate title of a written work.
	division	the process of separating something into parts.	Sub-division	the action of subdividing something
super-	market	an area where people regularly gather for the purchase and sale.	supermarket	a large self-service store that sells household goods and foods.
	Power	the ability to do something in a particular manner.	superpower	a very influential and powerful country.
Under-	Payment	the action of paying something.	Underpayment	a payment that is smaller than what is expected.
	graduate	a person who has completed a training or a course of study.	Undergraduate	a student at a university who has not yet achieved a bachelor's degree.

h. Verbs-to-adjectives

This pattern enables us to use verbs for forming other adjectives by commonly adding suffixes (such as -ive, -ous, -ent, and -able). Take a look at the following examples:

Suffixes	Verbs	Meanings	Adjectives	Meanings
-ive	attract	to cause to approach someone or something.	attractive	arousing interest or pleasure because of pleasing in appearance.
	effect	cause something to occur.	effective	successful in achieving an intended result.

Suffixes	Verbs	Meanings	Adjectives	Meanings
-ous	continue	keep happening.	continuous	without interruption in time.
	nerve	to give courage mentally to face a demanding situation.	nervous	easily to be anxious.
-ent	differ	to be unlike or distinct from another.	different	not the same as another.
	depend	be determined by.	dependent	bedetermined and conditioned by another.
-able	drink	take water into the mouth and swallow it.	Drinkable	suitable for drinking.
	count	determine the total number of something.	Countable	able to be counted.

i. Verbs-to-nouns

This pattern allows us use verbs for forming other nouns by adding suffix –er, -ance. –ment. take a look at the following examples:

Suffix	Verbs	Meanings	Other nouns	Meanings
-er	drive	operate the direction of a motor vehicle.	driver	a person who drives a motor vehicle.
	sing	produce musical tones with the voice.	singer	a person who sings professionally.
-ance	govern	to control and to direct the making of policy in a country.	governance	the action of governing.
	deliver	bring ordered goods to the proper recipient.	deliverance	the act of delivering something.

Suffix	Verbs	Meanings	Other nouns	Meanings
-ment	develop	cause something to grow.	development	the action of developing something.
	recruit	to persuade someone to join in a company for a job.	recruitment	the action of enlisting new people in a company or an organization.

If we closely look at those productive word formations of English, we will find out that affixation is apparently the most common way used by native speakers of English to form other or even new words in a language. However, human mind has an enormous capacity which enables speakers to go beyond affixation and gives other creative ways of forming words. The creative ways are recognized as not very common ways in word formation process in which native speakers of English seldom use these new processes. However, words resulted from these creative processes are occasionally adopted as the part of acceptable form of word by the larger linguistic community (Akmajian et al. 2017). The creative ways meant here are also known as less productive word formations that are discussed in the following section.

5.2 Less productive word formations

In addition to productive word formations, there are also less productive word formations. Less productive word formations refer to the processes of forming words which are uncommonly used to create other words in English. Less productive word formations include coinage, borrowing, blending, clipping, backformation, conversion and acronyms. Those are the focus for discussion in this section.

5.2.1 Coinage

Coinage is also recognized as neologism. It is named neologism because this word formation process invents entirely new words (neo) used to illustrate and describe new concepts or objects. This process is very rare and unusual way of forming words, but the change of technology, culture, and humans' life style require the speakers of English to coin new words to name their new

inventions resulted from the changes. Therefore, coinage may be then defined as the process of forming new words either accidentally or deliberately without employing the rules of word formation processes. according to Yule, G. (2010), often these new words are adopted by people in a community and become words used in the people’s everyday life. The representative example of coinage can be illustrated in the word ‘google’. In the past, the word Google was simply created to give a name of a company. google is commercially a trade mark of a company. Its meaning gradually changes from the name of a company to a specific term which is commonly used by almost all people in the globe meaning ‘to use internet to search and to obtain information. The other examples of some common coinages found in everyday english are available in the following list:

No	Coinages	Meanings
1	aspirin	A tablet which is used to relieve chronic pain and to reduce fever.
2	band-aid	A bandage that is used to cover minor wounds.
3	escalator	A moving staircase driven by a motor which has an endlessly circulating belt of steps.
4	factoid	A brief and significant information or news.
5	frisbee	a circular piece of plastic that has a curved edge thrown between people in a game.
6	heroin	a very addictive analgesic drug which is derived from morphine.
7	kerosene	A fuel oil which is especially used in the engines of jet engines.
8	kleenex	an absorbent disposable paper tissue.
9	laundromat	a coin-operated washing machines and dryers for public use.
10	linoleum	A smooth material which is used for covering floors.
11	muggle	a person without a particular type of knowledge or skill.
12	nylon	A strong fibre which is artificially woven.
13	psychedelic	a type of drug that can produce hallucinations and consciousness.
14	quark	one of the fundamental particles in physics.
15	Xerox	A brand name for a copier.
16	zipper	a device that has two flexible strips of metal or plastic used to fasten bags, garments, as well as other items.

5.2.2 Borrowing

In Morphology, the word ‘borrowing’ refers to the process of taking over words from other languages which are then adapted to be used in a language. After a word is borrowed from a particular language, the word is then called as a loanword or a borrowed word. English is one of languages which occasionally borrow words from other languages. Nordquist, R. (2019, June 30) even describes native speakers of English as ‘the most enthusiastic borrower’ because they historically have borrowed many words from approximately 120 languages all over the world. For examples of the borrowed words include: kebab and yoghurt (Turkish), whisky (Scottish Gaelic), Algebra and sofa (Arabic), Piano (Italian), mayonnaise (French), tattoo (Tahitian), zebra (Bantu), sherry (Spanish), waltz (German), bamboo and paddy (Indonesian), ski (Norwegian), tycoon (Japanese), and many more. Even if throughout history, English has been considered as ‘the most enthusiastic borrower’ for having borrowed a large number of words from other languages. However, today English is also called as ‘the leading source of borrowing’ for many other languages in more areas of life than just science and technology. According to Nordquist, R. (2019, June 30), borrowing in English commonly occurs due to some plausible reason i.e. the rapid change of technology and communication, other languages have words that have no equivalents in English language, there are many words for events, objects, political, cultural, or abstract concepts that are not found in the culture of English language.

5.2.3 Blending

Another less productive word formation of English is blending. Blending refers to the process of forming another or a new word with a new meaning by combining two separate words with different meanings. There are three ways of forming blended words. The first, blending is usually done by taking the beginning of the first word and the end of the second word, e.g. new words like *Indolish* (**I**ndonesian + **en**glish), *brunch* (**br**eakfast + **lunch**), *motel* (**mo**tor + **ho**tel), *camcorder* (**ca**mera + **re**recorder), *emoticon* (**em**otion + **ic**on), *frienemy* (**fr**ieend + **en**emy) and so on. The second, blending is formed by taking the beginnings of both words, e.g. new words like *cyborg* (**cy**ber + **or**ganism), *biopic* (**bi**ography + **pic**ture), etc. The third type of blending called ‘splinter’

is formed by taking whole parts of the first word and the end of the second word, e.g. new words like *guesstimate* (**guess** + **estimate**), *cheeseburger* (**cheese** + **hamburger**), *motorcade* (**motor** + **cavalcade**), *workcoholic* (**work** + **alcoholic**) and so forth. Nordquist, R.(2019, September6) states that as a dynamic language, English constantly tends to evolve, in which a large number of English words are not only derived from some European languages such as French or German, but also from Greek or Latin, because of the emergence of new cultural phenomena or new technology. However, starting from the 20th century, another type of word formation, that is blending, started to emerge used to describe the new cultural phenomena and the new technology.

5.2.4 Clipping,

clipping, in morphology, refers to the process of creating another word by taking one or more syllables from a multisyllabic word. Consequently, the part of the multisyllabic word is used to represent the whole, e.g. In Indonesia, we usually see nameplates of hand phone outlets say ‘eka cell’, ardan masogi cell, adam cell, etc. the word ‘cell’ is actually a clipping which is formed by taking one syllable ‘cell’ from a multisyllabic word ‘cellular’. the other examples of clipping are *phone* (tele-**phone**), *math* (**math**-ematics), *ad* (**ad**-vertisement), *exam* (**exam**-ination), *spec* (**spec**-ulation), *lab* (**lab**-oratory), *cap* (**cap**-tain), *demo* (**demo**-nstration), *porn* (**porn**-ography), *doc* (**doc**-tor), *prof* (**prof**-essor), *info* (**info**-rmation), *bro* (**bro**-ther), *sist* (**sist**-er) and various others. Such words produced by clipping are named clipped word or shortening. If we notice the clipped words, we will see that clipping is simply used to form another word by shortening a word without changing both the meaning and the part of speech of the word. However, the words created by the process of clipping are considered as colloquial and informal words. arnold, I. V. (1986) categorizes clipping into four categories namely: initial clipping, medial clipping, final clipping, as well as complex clipping.

a. Initial clipping

Initial clipping which also known as ‘procope’ refers to the process of cutting the initial part of a word and use the final part as another form of the word. for example: *phone* (it is another form of a word ‘telephone’,

the word is formed after cutting the initial part ‘tele’ and leave the final part ‘phone’ as another form of the word ‘telephone’), *bot* (ro-**bot**), *net* (inter-**net**).

b. Medial clipping

This type of clipping is also known as ‘syncope’. It is formed by leaving out the medial part of a word and use the initial and the final as the other form of the word. for example: *maths* (it is formed after leaving out the medial part of the word ‘ematic’ and leave the initial ‘math’ and the final part ‘s’ combined to ‘maths’ as another form of the word ‘mathematics’, *mam* (**ma-da-m**). and so on.

c. final clipping

final clipping is also recognized as ‘apocope’. this type of clipping is formed by cutting the final part of a word and use the initial as another form of the word. for example: *memo* (this word is another form of a word ‘memorandum’, the word ‘memo’ is formed after cutting the final part ‘randum’ and leave the initial part ‘memo’ as another form of the word), *gym* (**gym**-nastics), *pub* (**pub**-lic house), etc.

d. complex clipping

This type of clipping is formed using three ways namely: The first, two words are merged, but the final part of the first word is cut, e.g. *org-man* (**org**-anization + **man**). The second, two words are compounded, but the initial part of the second word is cut, e.g. *telegram* (cable + tele-**gram**). The third, two words are merged, but the final parts of the first and the second word are left out, e.g. *navicert* (**navi**-gation + **cert**-ificate).

5.2.5 Backformation

Back formation is another type of less productive word formations, in which another word is produced by removing the actual suffix of a certain word. For example, the word ‘edit’ is a verb which is produced after removing the supposed suffix –or of a noun ‘editor’. This has become a patter which is used to create many verbs from removing the suffixes of nouns. The term ‘back formation’ was firstly coined by James Murray in 1889 (<https://en.wikipedia.org/wiki/Back-formation>), a scottish who worked as the primary editor of the oxford e nglish dictionary from 1879 to 1915. at the time, Murray introduced the term ‘back-formation’ in the definition of a verb

‘to burgle’ which was derived from the old English noun ‘burglar’. Related to this matter, Huddleston & Pullum (2005) state that if we see the structure of the words created by word formation and affixation in derivation, no one is able to distinguish their forms, except to see their differences from the perspective of historical formation of the words. In other word, we may say that if another word is formed after removing the affix of an old English, Latin, or Greek word, it is a back formation. Here are some examples of English back-formation.

- aborigine from aborigines
- adulate from adulation
- automate from automation
- aviate from aviation
- bartend from bartende
- biograph from biography
- bulldoze from bulldozer
- cavitate from cavitation
- commentate from commentator

(https://en.wikipedia.org/wiki/List_of_English_back-formations)

In English, many words made of back-formations never get their real legitimacy to be used widely by the native speakers of English. Some are ignored or even aborted early. However, we may not deny that some still survive respectably and continuously make contributions to English (Garner, B., &garner, f . B. 2009).

5.2.6 Conversion

In morphology, conversion refers to the process of forming another word by converting or changing the part of speech (class) of a word without making a change to the word’s form (spelling and pronunciation). for example the word ‘google’, this word, in the past was only a noun which refers to the search engine to get information regarding something or someone on the internet, but in modern English, the word ‘google’ can be used as a verb which means ‘to search information concerning something or someone by using the search engine Google on the world wide web (the internet). Another example is the word ‘email’. t his word is originally a noun. after going through the process of conversion, the word ‘email’ experiences a change in its part of speech

(from a noun to a verb) without changing its spelling and pronunciation. In the past, we can only say 'I will send you an email immediately'. But today, we can also say 'I will email you immediately'. In English, conversion has several types, among other things:

a. Noun to verb conversion

This type of conversion is regarded as the most frequently used conversion in English. This conversion functions to change nouns to verbs. The following list contains some examples of verbs which are resulted from converting nouns.

- Bottle (noun).....To bottle (verb)
My mother puts the tea in a bottle (noun)
My mother bottles the tea (verb)
- Microwave (noun).....To microwave (verb)
I didn't put the fish in the microwave (noun)
Elli always microwaves a chicken for lunch (verb)
- Can (noun).....To can (verb)
Adam bought a can of tuna this morning (noun)
Adam cans his fruit (verb)
- Name (noun).....To name (verb)
Write your full name on the form (noun)
Hawa names her rabbit Kelincot (verb)
- Knife (noun).....To knife (verb)
The robber pointed a knife at John (noun)
She knifed her enemy at the back (verb)

b. Verb to noun conversion

This is another type of conversion which is also regarded as the frequently used conversion in English. This type of conversion functions to change the part of speech of a word, from verb to a noun. The following list gives the examples of this type of conversion.

- To hit (verb).....Hit (noun)
Parents are not allowed to hit their children (verb)
Your dance was a real hit at my birthday party (noun)
- To attack (verb).....Attack (noun)
A snake will not attack, unless it is provoked (verb)
The US soldiers have made an attack on Baghdad (noun)

- To call (verb)Call (noun)
I have called my twins Adam and Hawa (verb)
I got a call from a beautiful girl last night (noun)
- To cheat (verb).....Cheat (noun)
He cheated me by charging too much for this computer (verb)
Your friend is a cheat (noun)
- To cry (verb).....Cry (noun)
I could hear someone crying last night (verb)
I was wakened by a cry ‘thief’ (noun)

c. other types of conversion

other types of conversion also occur in English. However, they are less frequently used. These types also function to change the part of speech but not in spelling and pronunciation as well.

- Adjective to noun conversion
Final (adjective).....Final (noun)
She is not coming and that’s final (adjective)
I got through to the final last year (noun)
- Adjective to verb conversion
Empty (adjective).....To empty (verb)
Adam takes all the empty bottles (adjective)
I empty my pocket for her (verb)
- Conjunction to noun conversion
If, and, but (conjunctions)..... If, and, but (nouns)
If I can go (conjunction)
no if, please (noun)
- exclamation to noun
wow (exclamation).....wow (noun)
Wow, what a beautiful girl (exclamation)
I like your wow (noun)

5.2.7 Acronyms

acronym is another type of word formation which refers to the process of forming another word by taking the first letter of a group source words to frame a concept. for example, nasa in English is considered as a word that is created by an acronym process. This word is made of a combination

of the first letters of a group of source words namely: National Aeronautics and Space Administration. The spelling of a word created by acronym is usually written in capital letters such as VIP (for Very Important Person), asean (for association of southeast asian nations), Html (for Hypertext markup language), Http (for Hypertext transfer Protocol), etc. acronyms may be pronounced in two ways, i.e. The first, an acronym is pronounced as a word when the acronym is constructed by a combination of consonant and vowel letters in favorable position to be pronounced as a word, e.g. FIFA (for Fédération Internationale de Football Association), *LASER* (for Light Amplification by Stimulated Emission of Radiation), ICONELE (for International conference on english language education), etc. If an acronym is constructed by a string of consonant (e.g. HTML) or a combination of consonants and vowels letters, but not in favorable place (e.g. FBI), the acronym is only pronounced as a string of letters Html is pronounced as /eɪtʃˌtiːˌɛmˈel/ and FBI is pronounced as /ɛfˌbiːˈaɪ/.

CHAPTER SIX

UNDERSTANDING SYNTAX

I ascribe a basic importance to the phenomenon of language. To speak means to be in a position to use a certain syntax, to grasp the morphology of this or that language, but it means above all to assume a culture, to support the weight of a civilization.

(Frantz Fanon)

In this chapter, let us switch our attention to the study of syntax. syntax is commonly known as the study of sentence structures. structure means the processes of combining words to form phrases and phrases to form sentences. Without syntax, it will be very difficult to put words in a good order which consequently makes sentences gibberish and understandable to native speakers of a certain language. Besides, changing the standard word order of a language will absolutely change the meaning. Even it can make the sentences meaningless. In English for example, the meaning of ‘I must learn linguistics’ is very different from ‘must I learn linguistics?’ and is meaningless in ‘learn I linguistics must’. therefore, many linguists share the same view that syntax plays a decisive role in forming good sentence structure which is very important to sentences meaning recognition in a language.

1. The word ‘Syntax’ defined

Discussing the definition of syntax is essential to begin the discussion of this chapter because knowing information regarding syntax’s definition will make it easier for us to understand the essence of this study. What I mean by the essence in this context refers to the most important idea behind syntax

as one of major disciplines in linguistics. For the reason, I need to provide comprehensive definitions from two important sources i.e. online dictionary source and linguist source. let's start exploring the essence of syntax according to online dictionary source.

- according to <https://www.merriam-webster.com>, syntax is defined as “the way in which linguistic elements (such as words) are put together to form constituents (such as phrases or clauses)”.
- <https://dictionary.cambridge.org> defines “syntax as the grammatical arrangement of words in a sentence”.
- according to <https://www.dictionary.com> , “syntax is the study of the patterns of formation of sentences and phrases from words”.
- <https://www.thefreedictionary.com> says that “syntax refers to the ways in which we order specific words to create logical, meaningful sentences”.
- <https://www.collinsdictionary.com> says that “syntax is the ways that words can be put together, or are put together, in order to make sentences”.
- according to <https://www.yourdictionary.com>, “syntax is an order of words and phrases to form proper sentences”.

In addition to exploring the idea of syntax from the definitions provided by the online dictionaries, it is essential that we consider the idea of syntax based on definition of syntax given by linguists, among other things:

- Crane, L. B., Yeager, E., & Whitman, R. L. (1981:102) state that “syntax is the way words are put together to form phrases and sentences”.
- Poole, S. C. (1999:83) is the opinion that “syntax is the study of utterances’ structures”.
- Becker, A., & Bieswanger, M. (2004:100) define “Syntax as the branch of linguistics that seeks to describe the rules which enable us to recognize and generate an unlimited number of such units from a limited set of means”.
- Meyer, C. F. (2009:111) defines “syntax as the study of how words are grouped and ordered within sentences, clauses, and phrases”.
- Akmajian, A., et al. (2017:149) state that “syntax is the study of larger structural units of language: phrases and sentences”.

Of all the definitions, there are at least two underlying concepts to understand what syntax is, i.e. the concept of sentence and the concept of structure.

- a. the concept of sentences refers to the largest unit of a language constructed from a group of words that typically has a subject and a predicate.
- b. The concept of structure refers to the arrangement of a group of words applying a set of rules.

Based on the two underlying concepts of syntax, we may then define syntax as the study of sentences as the largest units of a language that are constructed by applying a set of rules. Therefore, discussing syntax means to discuss two things i.e. how sentences are constructed in a language and what rules are used behind the construction of the sentences. These are respectively going to be discussed as follows.

2. The Concept of Sentence in Approaches to Syntax

When we communicate using a language, we will generally produce a series of sentences delivered to our interlocutors. The sentences that we can produce when communicating are unlimited. We are able to produce these sentences not because our brain has stored them, but simply because our brain stores not only words with their linguistic properties, but also stores a set of rules that are used to arrange the words to form phrases, clauses, as well as sentences used to represent messages in our mind. The question now is ‘how can our brain store knowledge of these words and set of rules?’ In general, we have acquired all this knowledge since we were children, precisely when we learned our first language. It is this knowledge that enables us to recognize and to produce unlimited number of sentences. It is also this knowledge that enables us to intuitively distinguish between grammatical sentences (well-form) and ungrammatical ones (ill-form) without necessarily being able to explain how and why. However, in more specific context, e.g. the context of foreign language, many of us have the knowledge due to a language learning process. What I mean by language learning is that our mind stores a foreign language words and rules through formal instructions and interaction between language teachers and language learners in the classroom. Apart from the fact that we acquire or learn the language knowledge that has enabled us to articulate and perceive sentences in our social interactions, sentence has become the center or the representation of our language knowledge.

every day, we use our knowledge of language to make and understand sentences which even have never been used and heard before. In this regard, Crane, L. B., Yeager, E., & Whitman, R. L. (1981:106) state that “the number of sentences a speaker may produce and understand is unlimited, but his or her knowledge and sentences actually produced are not”. Therefore, syntax studies unlimited sentences to find a limited set of rules (grammar) from which the unlimited sentences are constructed. A number of theories (approaches) of syntax have made considerable efforts to describe not only what sentence is, but also what sort of rules the speakers of a particular language use when making sentences such as the traditional approach, the structuralist approach, and the transformational-generative approach (Crane, L. B., Yeager, E., & Whitman, R. L. 1981). The approaches are briefly discussed as follows:

2.1. The Traditional Approach to Syntax

In this approach, sentence is recognized as a language product which is formed as the result of the relationship between words and phrases. The construction of sentence is analyzed by a form analysis called ‘The Reed-Kellogg Sentence which was used in most American public schools until 1950s (Crane, L. B., Yeager, E., & Whitman, R. L. 1981). This tool is regarded very simple and functions to provide information regarding the relationship between words and phrases in terms of a subject and a predicate. Subject refers to a noun, a noun phrase, or a pronoun that functions as the agent (who or what does an action in the sentence). In addition, predicate refers to the part of a sentence that informs us what the agent does or is. To put it another way, predicate is everything which is placed after the subject in a sentence. For example, analyzing a sentence ‘the smart teacher trained the lazy boy patiently’. Crane, L. B., Yeager, E., & Whitman, R. L. (1981:103-104) describe the process of analyzing such a sentence that:

“To begin the analysis, the diagram first of all shows that this sentence contains two key elements namely: a subject and a predicate which are indicated on a horizontal line divided by a vertical line. The object is also indicated on the horizontal line, and it is separated from the predicate by a vertical line that does not cross the horizontal line. All modifying words are placed on slanted lines under the words they modify”.

For a clearer illustration, take a look at the following figure that shows how Reed-Kellogg sentence diagram works.

Figure 16
The sentence diagram of Reed-Kellogg

If we look at the results of the sentence analysis more closely, it is clear that the analysis is very simple. This approach finds a set of rules for the formation of sentences that do not match the complexity of English sentences in reality. Therefore, many of the linguists assume that the rules are too simple and inconsistent so they cannot be used not only as a guide to deduce the actual structure and grammar of English, but also as a representation of complexity of sentence structures and grammar in English. Nevertheless, it cannot be denied that this theory has provided the first foundation for linguists to find the other better approaches to the analysis of sentence structures in English.

2.2. The Structuralist Approach to syntax

As an effort to revise the traditional approach to syntax, structuralists introduced another approach called ‘the structuralist approach’. This approach confirms that a sentence is actually a combination between a sequence of word classes and groups. The sequence of the word classes and groups is also known as a sentence pattern. The sentence pattern classifies a sentence into elements, i.e. the element of class I words (these words have the properties of nouns), the element of class II words (they share the properties of verbs), and the element of group A words (the words have the properties of modifiers). So, a sentence ‘The boy kicked a ball’ is analyzed this way:

However, the concept of sentence pattern, as for most linguists, is regarded as an exhausting chore of no great merit in understanding structures within sentences (Crane, I. B., Yeager, E., & Whitman, R. L. 1981).

Having had such a criticism, the structuralists revised the theory by introducing another concept that is immediate constituent (IC) analysis. This was firstly introduced by a prominent structuralist Leonard Bloomfield in 1933s (<https://www.britannica.com>). IC is a method of sentence structure analysis that divides a sentence into successive constituents. A constituent contains a word which enters into a larger structure within a sentence. In other words, immediate constituents are successive words that form a unit (from the smallest to the largest unit). When a sentence is analyzed, a unit or a constituent is placed into a box, in which the smallest box indicates the smallest constituent. For example, a phrase 'the beautiful girl' is analyzed as follows:

The analysis indicates that A (the), B (beautiful), C (girl) are small constituents. B (beautiful) is an immediate constituent to C (girl) that forms a larger constituent D (beautiful girl), A (the) is an immediate constituent to D (beautiful girl) that finally forms the largest constituent E (the beautiful girl). In addition to the example of analyzing a noun phrase, let's take a look at how a sentence 'the teacher teaches his students effectively' is analyzed by using IC analysis.

The method of sentence structure analysis as shown by IC, as for some linguists, is viewed inconclusive because it only gives a set of binary structural patterns (Mudshah, B. A. D., Al-Takhayneh, A. H., & Al-Dala'ien, O.

A. 2015) and is unable to give a comprehensive description of the relationship between words within sentences (Crane, L. B., Yeager, E., & Whitman, R. L. 1981). Hence, if we analyse a sentence by using IC analysis, we will only provide binary structures between words (the structure patterns), but we cannot describe the words' grammatical relationships (the grammar patterns) to show the semantic relation of the words.

2.3. The Transformative-Generative Approach to Syntax

Due to the criticism given to the structuralist approach, a new approach is then posited that is called the transformative-generative (tg) approach. This approach was firstly introduced by Noam Chomsky in 1950s (<https://www.britannica.com>). Chomsky believes that speakers of a certain language are able to produce and perceive sentences in communication because they have linguistic competence and linguistic performance. Linguistic competence refers to the speakers' knowledge of the rules of their language which consists of the phonological rules (the system of sound), syntactical rules (vocabulary and grammar), and semantical rules (intentions or meanings). On the other hand, linguistic performance refers to the act of using the linguistic knowledge in communication. In this regard, Crane, L. B., Yeager, E., & Whitman, R. L. (1981:107) are of the opinion that "competence is an essential part of performance". If the outcomes of linguistic performance are sentences, the sentences must be formed by the system of rules (linguistic competence). Therefore, sentence is then defined as combinations of words which are governed by a system of rules (grammar). The operation of the system of rules to produce sentences is called transformations. The transformative generative linguists have taken competence as the focus of analysis in syntax. They use the approach to determine what rules are applied for the formation of sentences in a language and how the rules work together to form the sentences of the language.

In analyzing sentences, the linguists of tg assert that a sentence consists of two syntactic components, i.e. the base component and the transformational component. The base component refers to two things namely: a set of rules (phrase structure rule) that give constituent structure (the way various words are combined) to sentences, and lexicons (a list of words used to indicate a particular structure). The outcome of the base component is the deep structure

(the basis for meaning of a sentence). The deep structure becomes the basis for activating the transformational component. The transformational component refers to a set of rules that turn the deep structure into the surface structure. The surface structure feeds into the phonological rules. In other words, we may say that the deep structure is an abstract concept which represents the meaning of a sentence. On the other hand, the surface structure is an actual sentence that we hear in a verbal communication. The following figure illustrates the syntactic component in analyzing sentences.

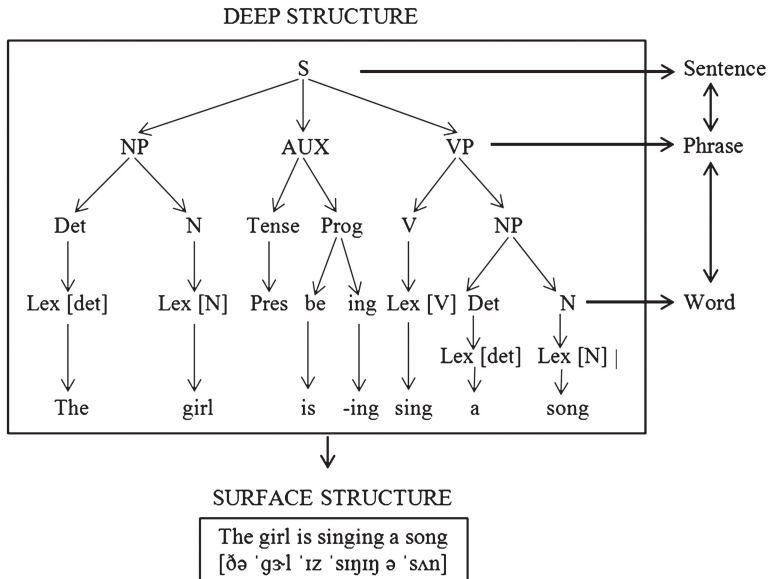

Figure 17
The syntactic component of TG Approach

For example, a sentence ‘the girl is singing a song’ is analyzed by using the transformative generative approach as follows:

the results of the sentence analysis show that from the perspective of the transformative generative approach, sentences are formed from a series of phrases and phrases are formed from a series of words. the process of constructing words into phrases and phrases into sentences is called transformation. to carry out the transformation process, a set of rules is needed as shown in the deep structure box. For example the rule of sentence formation stipulates that sentences are generally formed from three main components namely noun phrases, auxiliary, and verb phrases. This rule follows the pattern $S = NP + AUX + VP$. The discussion of the rules used in the structure of sentence formation is going to be presented in the next sub-topic. What needs to be made clear is that of the three approaches, it is the transformative approach that is currently used more by linguists to explain sentences and their formation processes (grammar) of a particular language. even Becker, a., & Bieswanger, m. (2004) called the approach as the contemporary approach.

3. The Structure of Sentences

In this section, the structure of sentence is described by using the perspective of tg approach. this approach views that the structure of sentence must be analyzed using a phrase structure. According to Crane, L. B., Yeager, E., & Whitman, R. L. (1981:109), “a phrase structure grammar is a series of rewrite rules that break down sentences into their basic structures”. In more detail, phrase structure has three fundamental principles, i.e. every word is a lexical category, a lexical or a group of lexical categories form phrases, phrases are formed by a set of rules called phrase structure rules, and phrase structure rules are represented into phrase structure trees (de marcken, c. 1995). Phrase structure rules effectively function to determine what lexicons go into a phrase and how the lexicons are organized to form the phrase. on the other hand, the phrase structure trees show three aspects of the sentence structure, i.e. linear order of lexicons in the sentence, the grouping of the lexicons into phrases, and the hierarchical structure of the phrases. for example, the phrase structure rule introduces a generalschema that $X \rightarrow Y + Z$ which means that X is constructed by Y and Z. This general schemais then interpreted as the first phrase structure rule namely; $S \rightarrow NP + (Aux) + VP$ which means that a sentence (S) is generally constructed by a noun phrase (NP) then successively followed by an auxiliary (Aux) and a verb phrase

(VP).the general schema is the represented in the phrase structure trees as follows:

with regard to english, no phrase structure rule of english is fully accepted due to limitations, revisions and the change in linguistics theories (c rane, l. B., Yeager, e., & whitman, r. l. 1981).nevertheless, it is still important to show parts of phrase structure rules, i.e. noun Phrase (n P), a uxiliary (Aux), Verb Phrase (VP), Prepositional Phrase (PP), Conjoined Phrase (CP) to generate the deep structure of some english sentences.

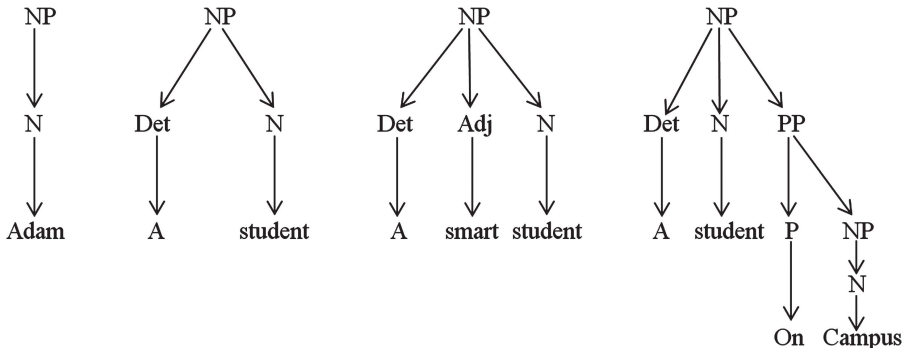

3.1. Noun Phrase (NP)

- Adam N
- A student Det + N
- A smart student Det + Adj + N
- A student on campus Det + N + PP

Phrase structure rule for a noun Phrase (nP)

$$NP \rightarrow (Det) + (Adj) + N + (PP)$$

Referring to the rule, round brackets ‘ () ’ indicate optionality (not obligatory). when the phrase structure rule is converted into phrase structure tree, we get a schema of the phrase structure tree as follows:

3.2 Auxiliary (Aux)

- **Goes** t ense (pres) + Ø/-s,es,
- **Worked** t ense (past) + -ed
- **Is speaking** t ense (prog) + be + -ing
- **Have taken the book** t ense (perf) + have + -en
- **Will come** t ense (modal)

Phrase structure rule for auxiliary (aux)

$$\text{Aux} \rightarrow \text{T} + (\text{past}) + (\text{pres}) + (\text{prog}) + (\text{perf}) + (\text{M})$$

Referring to the rule, round brackets ‘ () ’ indicate optionality (not obligatory). When the phrase structure rule is converted into phrase structure tree, we get a schema of the phrase structure tree as follows:

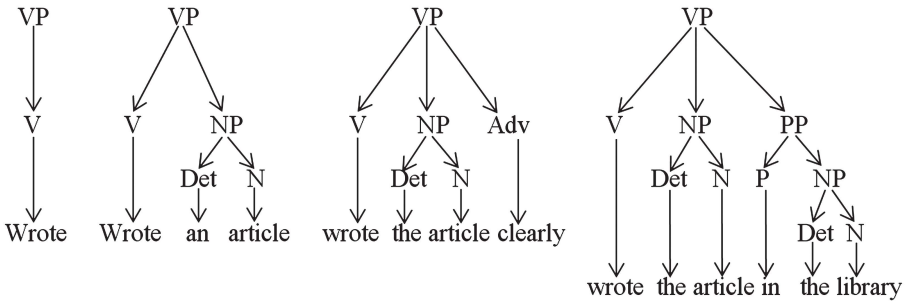

3.3. Verb Phrase (VP)

- **Wrote** V
- **Wrote the article** V NP
- **Wrote the article effectively** V NPAdv
- **Wrote an article in the library** V NP PP
- **Came into the room angrily** V PPAdv

From the examples, we can formulate phrase structure rule for Verb Phrase namely:

$$\text{VP} \rightarrow \text{V} + (\text{NP}) + (\text{PP}) + (\text{Adv})$$

According to the rule, round brackets ‘ () ’ show optionality or not an obligatory. When the phrase structure rule is applied to make phrase structure tree, we get a schema of the phrase structure tree as follows:

3.4. Prepositional Phrase (PP)

- **In** **In**
 - **From a teacher in the classroom** **P NP**
- Phrase structure rule for prepositional phrase (PP)

$$PP \rightarrow P + (NP)$$

Referring to the rule, round brackets '()' indicate optionality (not obligatory). when the phrase structure rule is converted into phrase structure tree, we get a schema of the phrase structure tree as follows:

3.5 Conjoined Phrase (CP) and Conjoined Sentences (CS)

In constructing English phrases or sentences, we frequently combine words, phrases, as well sentences that have the same category using conjunctions such as but, and, or, etc. For example:

- A book and a pencil
- c ome, pray, and eat
- Adam bought a bird, but he returned it

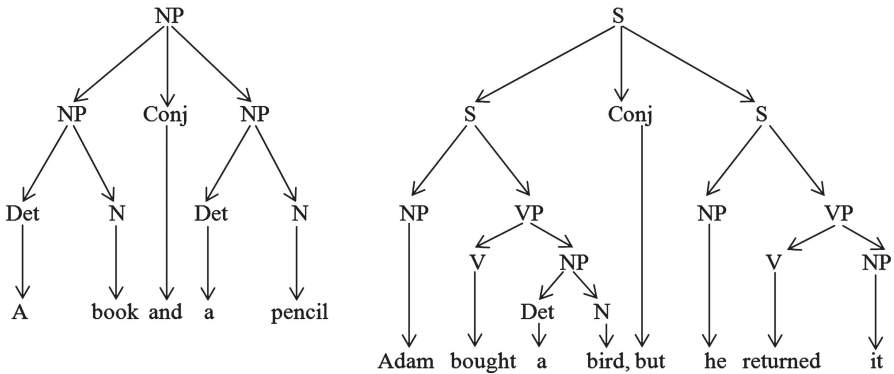

The general structure rule for conjoined phrase and conjoined sentence:

$$X \rightarrow X \text{ Conj } X$$

However, the rule can be illustrated in more specific structure rule representation.

when the phrase structure rules are converted into phrase structure trees, we get the phrase structure trees as follows:

By knowing the rules of phrase structure as presented above, we can then use the rules to analyze and to find the deep structure of sentences in English. For example, we can analyze the following sentences and find out the deep structure behind them.

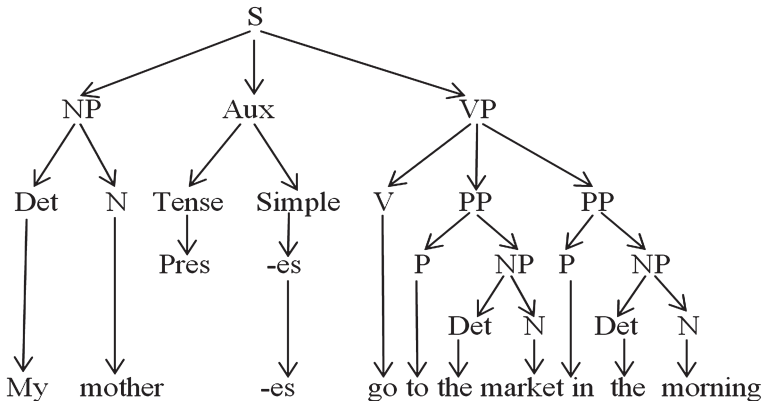

- Adam has arrived in the airport

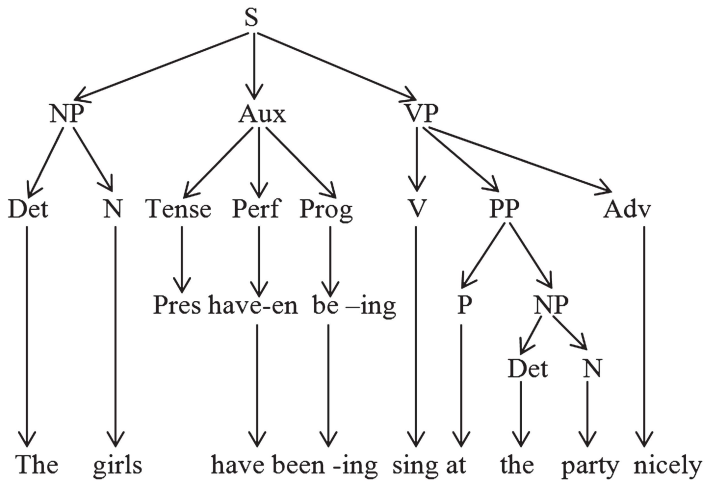

- I will teach the students

- My mother goes to the traditional market in the morning

- **The girls have been singing at the party nicely**

CHAPTER SEVEN

UNDERSTANDING SEMNATICS

Semantics is about the relation of words to thoughts, but it also about the relation of words to other human concerns. Semantics is about the relation of words to reality - the way that speakers commit themselves to a shared understanding of the truth, and the way their thoughts are anchored to things and situations in the world.

(Steven Pinker)

when two people are communicating using a language (for example: English), they will probably use some words which have similarity in meanings, but different in use, e.g. the word 'error' and 'mistake'. These words technically mean similar. Therefore, many people use them interchangeably due to the words' meaning similarity. However, semantics' analysis informs us not only regarding the words' similar meanings, but also the difference in use. In this regard, error is used to indicate a systematic deviation of language use committed by a learner because he doesn't know the rules of the language. On the other hand, mistake is used to show a deviation of language use committed by a learner not because of lack of language knowledge, but simply because of incidental slip of the tongue or forgetfulness. It is the importance of semantics. this chapter is concerned with linguistic meaning or semantics as another important element in language study.

1. The word 'Semantics' defined

In this chapter, understanding the semantics is done by studying the definitions of semantics using two different points of view, namely: understanding semantics through definitions expressed in online dictionaries

and through definitions put forward by linguists. By presenting the semantic definition based on both viewpoints, it is expected that the essence contained in the discipline can be clearly understood. In the following, semantics definitions are obtained from online dictionary sources.

- According to <https://www.vocabulary.com>, “Semantics is the study of meaning in language. It can be applied to entire texts or to single words”.
- In <https://www.dictionary.com>, it is stated that “Semantics is the study of meaning in language by classifying and examining changes in meaning and form”.
- <https://www.collinsdictionary.com> says that “Semantics is the branch of linguistics that deals with the meanings of words and sentences”.
- <https://dictionary.cambridge.org> defines “Semantics as the study of meaning in language”.
- According to <https://www.urbandictionary.com>, “Semantics is the study of discussing the meaning/interpretation of words or groups of words within a certain context”.

In addition to the definitions, some definitions are also provided by linguists as follows:

- Crane, L. B., Yeager, E., & Whitman, R. L. (1981:129) define “semantics as the study of meaning”.
- Lyons, J. (1981:136) “Semantics is the study of meaning with particular reference to meaning in language”.
- Filip, H. (2008:8) is of the opinion that “Semantics is the study of meaning expressed by elements of any language, characterizable as a symbolic system”.
- Becker, A., & Bieswanger, M. (2004:137) assert that “Semantics is the systematic study of meaning in human language. It is concerned with the linguistic meaning of words, phrases and sentences”.
- According to Yule, G. (2010:114), “Semantics is the study of the meaning of words, phrases and sentences”.

Having read the definitions of semantics provided by both sources, we can then identify two key concepts which are mutually shared within the definitions, i.e. the linguistic meaning of word, phrases, as well as sentences, and their interpretations. The two key concepts are then used for providing an alternative definition of semantics in this work. Semantics is a study that

examines the meaning and the interpretation of words, phrases, and sentences in language. The discussion of the key concepts within the definition is discussed as follows.

2. Meaning in words, phrases, and sentences

when we communicate with others using a particular language, we use and combine words to construct larger units of language such as phrases and sentences which meanings are familiar to us. we exactly know the meanings of those units because we have ever used them in our verbal communications previously. In regards to the meaning of words, phrases, and sentences, Becker, a., & Bieswanger, m. (2004) put the study of meaning into two separate categories namely: lexical semantics and sentential semantics. lexical semantics is focused on studying the meaning of words and the meaning's relationships among words. on the other hand, sentential semantics is focused on studying the meaning of larger units than words, (i.e. phrases, clauses, and sentences) and the meaning's relationships among them. then, the two semantic branches are discussed to describe meaning in words, phrases, and sentences.

2.1. Lexical Semantics

In the chapter of morphology, I have provided the definition of word based on morphological perspective in which word is defined as the smallest element of language that can be uttered or written, has a word class form, and still has meaning even if it stands alone. However, morphology simply studies the structure of words. lexical semantics, on the other hand, studies the meaning of words.

a. The meanings of words and Dictionary

When we talk about the meaning of words, we would probably ask a question, how do learners get information concerning the meanings of words? One of sources that learners can use to obtain information concerning the meanings of words is dictionary. Today, we can easily find two kinds of dictionary. they are printed dictionary and online dictionary. according to Sarigül, E. (1999:153), “a printed dictionary is a reference book containing the words of a language usually alphabetically arranged, with information

on their forms, pronunciations, functions, meanings, etymologies, spellings and idiomatic uses”. Based on the definition, we can understand that a printed dictionary refers to a book that lists the words of a language containing a linguistic history of the words, synonyms, as well as examples of sentences describing how the words are used in a social context. A linguistic history means that the dictionary provides four types of linguistic information, i.e. semantic information (the meaning), phonological information (the pronunciation), syntactic (the part of speech), and sociolinguistic information (social distinctions among usages). on the other hand, <https://www.dictionary.com> defines “online dictionary as a dictionary available on the Internet which offers direct access through large databases to a word’s spelling and meanings, plus a host of ancillary information, including its variant spellings, pronunciation, inflected forms, origin, and derived forms, as well as supplementary notes on matters of interest or concern about how the word is used”. If we notice the definitions of both printed and online dictionary, we can obviously see that there are at least seven kinds of information mutually shared between both types of dictionary namely:

- words’ spellings
- words’ standard pronunciations
- one or more meanings of the words
- words’ grammatical usage
- Words’ part of speech such as verb, noun, adjective, etc.
- examples in sentences to show how the words are used
- words’ synonyms and antonyms.

As for the learners, those types of information may become advantages of a dictionary to help them satisfy the needs for linguistic information on english words. It stands to reason for saying that in language pedagogy, the importance of using dictionaries cannot be ignored because the dictionaries are apparently able to be extremely useful for two purposes, i.e. to provide them learning resource for unfamiliar words, and to make them more independent in learning (they can learn without a language teacher). according to sarigül, e . (1999), it is important to train the learners about how to use a dictionary effectively because the skill in using a dictionary properly will help them in selecting the meaning of a word that is appropriate to a particular context.

When a learner has a concept in mind, but the learner doesn't know how to put it in word. Then, he/she has to find the right word in the dictionary to express the concept. However, the learner sometimes runs into a problem of choosing appropriate meaning to the given concept when a selected word has several meanings. for example, an english word 'see' has several meanings provided by <https://dictionary.cambridge.org> (an online English dictionary), among other things:

- to be conscious of what is around you by using your eyes
from the door, I could see the students singing in the hall
- to watch a movie or a t V program
did they see that movie last night?
- to understand, know, or realize
He can't see what I mean
- to meet or visit someone, or to visit a place
my sister is going to see a doctor next week
- to have a romantic relationship with someone
How long has he been seeing her?

From the example, we can clearly see that the word's meanings can be interpreted differently due to the different discourses. t herefore, it is a good idea to advise language learners to grasp the different meanings of a word by means of dictionary usage for the sake of facilitating them to use the word according to its proper contexts.

nevertheless, most dictionaries simply attempt to provide the learners with denotative meaning of words that is the first or the direct meaning of a word that most native speakers of a language exactly know. t herefore, the denotative meaning (also known as denotation or meaning without emotions) is considered as the standardized meaning of word within the language. In addition to denotative meaning, a word sometimes has connotative meanings. c onnotative meaning is the secondary meaning of a word that is the meaning implied by a word apart from its explicit meaning. Connotative meaning (also known as connotation) carries cultural and emotional meanings conveyed speakers due to their experiences and opinions. for example w all street, this phrase has a denotative meaning that is a street in in lower m anhattan, n ew York where financial institutions (such as the Stock Exchange and banks) are. In addition to the denotative meaning, it also has connotations such as 'greed',

‘power’, or ‘wealth’ which is expressed based on the speakers’ experiences and opinions about it. In short, when we talk about the meanings of words, it concerns with either denotative or connotative meaning.

b. Meaning relationship among words

In social interaction, we often use words that have meanings related to one another. for example, I’m writing an essay on speaking skills. as an effective writer, I will make effort to avoid using the word ‘speak’ repeatedly in my essay. therefore, I must use a good writing strategy that is to choosedifferent words whose meanings are the same or nearly the same as the word ‘speak’such as ‘say’, ‘convey’, or ‘communicate’. the choice of words indicatesmeaning’s relationship among words in language and such phenomenon in semantics is known as synonyms. t herefore, after studying and understanding the concept of meaning in words (denotative meanings and connotative meanings), we are also in need of studying the concept of meaning relationship among words since words that we use to form sentences when communicating, can be semantically related. The following discussion describes how semantics views the ways in which words’ meanings can be related one another.

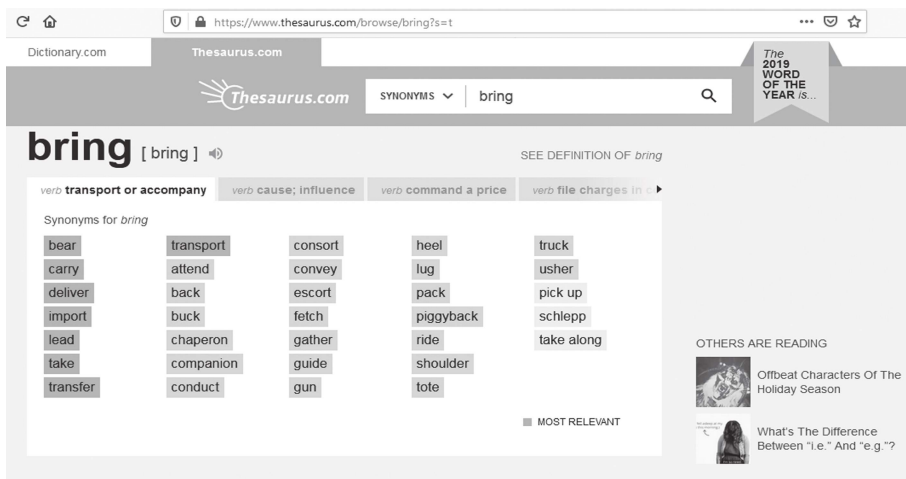

- Homophony

Homophony is a relationship of meaning between words which is established because two or more words have the same pronunciation but the spelling and meaning of the words are different. words with this kind of meaning relationship are called homophones. t ake a look at the following examples:

No	Spellings	Pronunciations (AE)	Meanings
1	Bare (adj)	bɛr	Not covered by anything
	Bear (v)	bɛr	t o endure something
2	flour (n)	'flaʊər	finely milled wheat
	flower (n)	'flaʊər	The blossom of a plant
3	son (n)	sʌn	a male child
	sun	sʌn	The ball of fire in the sky

- Synonymy

Synonymy is the relationship of meaning between words formed because two or more words in a language have the same or nearly the same meaning, the same part of speech, but have different spellings. Such words are called synonyms. Synonyms can be used to mean the same thing in the same context. In writing, utilizing synonyms is highly recommended because it brings a nuance of sentence variations in a text and makes the text more comfortable to read. If a writer needs synonyms, the writer can use a thesaurus. a thesaurus is a resource similar to a dictionary that lists words in groups of synonyms. In this digital era, we can easily access <https://www.thesaurus.com/> to search synonyms that we need to use in our text. for example, we are writing a text and we need to use the synonyms for a word ‘bring’. By using <https://www.thesaurus.com/>, we can find the list of synonyms for ‘bring’ as follows:

- Antonymy

Antonymy is a relationship of meaning between words that is formed since two or more words have the same part of speech, but the meanings’ of the words are opposite or almost opposite. such words are referred to as antonyms. t o know the antonyms for a word easily, then we can also use <https://www.thesaurus.com/>. For example, we want to find the antonyms for a word ‘big’, <https://www.thesaurus.com/> will then show a list of antonyms for the word ‘big’ as follows:

Specifically, Becker, A., & Bieswanger, M. (2004) classify antonymy into four categories, namely: complementary antonymy, gradable antonymy, relational antonymy, and directional antonymy. complementary antonym refers to the relationship of meaning between two words that contain positive and negative meaning. For example, the relationship between the meaning of two word 'alive' and 'dead' in which the word 'alive' is considered to have positive meaning, but the word 'dead' is considered to have negative meaning because the word 'dead' means the same as 'not alive'. Next, gradable antonymy refers to the relationship of meaning between two words that can be measured or compared either in comparative or superlative. for example, the meaning relationship between the word 'big' and the word 'small' where the meaning of the two words can be measured based on size or shape. Furthermore, relational antonymy refers to the relationship of meaning between two words that have opposite roles. For example, the meaning relationship between child and parents, students and teachers, selling and buying, and so on. Finally, directional antonymy refers to the relationship of meaning between two words that indicate the opposite direction of a movement e.g. come and go, up and down, etc.

- Polysemy

Polysemy is the relationship of meaning between two or more words, where the words are sounded and spelled alike but have different meaning. According to linguists, polysemy occurs because of the capacity of a word to have more than one meaning (multiple). such words with more than one meaning are also called lexical ambiguity since their meanings are ambiguous.

For example, the word ‘get’ can be a good example of a polysemy, in which ‘get’ can mean as follows:

- a. To obtain or to earn something
I went to the book shop to get some ink
- b. To arrive at a particular place
w hat time do you usually get home?
- c. To become
t he water is suddenly getting cold
- d. t o understand
I don’t get what you are saying.
- e. t o pay for something
Put your money away, I will get these dresses

- **Metonymy**

Metonymy is the relationship of meaning between two or more words because these words have meanings that are generally associated with certain objects or concepts. The relevance of the meaning of these words can be based on a container to contents relation (e.g. bottle: water), whole to parts relation (e.g. car: wheel), or representative to symbols relation (e.g. king: crown).

In everyday life, we unconsciously often use metonymy. for example: when we are having lunch, instead of saying, “The rice, fried fish, chicken legs, and boiled eggs are delicious.” We prefer to say, the dish is delicious. Here, we avoid mentioning all separate parts of our meals because that would sound very strange. so to make our sentence sounds more concise and clear, we use metonymy.

- **Collocation**

Collocation is a relationship of meaning between words that occurs because the words are a meaningful combination that is often (habitually or frequently) used together in natural language. for example, it is unnatural to say “speak obviously please!” because ‘speak’ as a verb does not collocate with ‘obviously’ as an adverb in English. It is natural to say “speak clearly please!” because ‘speak’ collocates with ‘clearly’ in English. Another example taken from Indonesian, it is unnatural to say ‘meninggal lampu’ (no light due to blackout), but it is natural to say ‘mati lampu’. An easy way to understand

collocation is to divide it into two parts, i.e. co: meaning together and location: meaning place. so, collocation refers to words that are used together in a location. knowledge of collocation, especially english collocation, is very useful to help efl learners speak and write natural-sounding english. For the reason, to learn a lot about English collocation, we can visit an online english collocation dictionary called online oxford collocation dictionary at <http://www.freecollocation.com/>.

Online Collocation Dictionary

Q

A completely new type of dictionary with word collocation that helps students and advanced learners **effectively study, write and speak natural-sounding English**. This *online dictionary* is very helpful for the education of the IELTS, TOEFL test.

Level: Upper-Intermediate to Advanced

Key features of oxford dictionary online

1. Collocations/collocation - common word combinations such as '*bright idea*' or '*talk freely*' - are the essential building blocks of natural-sounding English. The dictionary contains over 150,000 collocations for nearly 9,000 headwords.
2. The dictionary shows words commonly used in combination with each headword: nouns, verbs, adjectives, adverbs, and prepositions, common phrases.
3. The collocation dictionary is based on 100 million word British National Corpus.
4. Over 50,000 examples show how the collocation/collocations are used in context, with grammar and register information where helpful.
5. The clear page layout groups collocations according to part of speech and meaning, and helps users pinpoint speedily the headword, sense and collocation they need.
6. **Free Download – OXFORD Collocations Dictionary**

2.2. Sentential Semantics

After briefly discussing the meaning in words and the relationship of meaning among words, we now move on to the next discussion that is to examine the meaning in sentences and the relationship of meaning among sentences. all this time, we use more sentences when we communicate. the sentences that we use are a series of words that are put together according to structural and grammatical rules so that the sequence of words contains a broader meaning than the meaning of each individual word. When we study meaning in a broader context that is meaning in phrases and sentences, then that's when we study sentential semantics. to examine the meaning in

phrases and sentences, we use the principle of compositionality which says that the meaning of a sentence in language is determined by the meaning of its individual words and the way they are arranged structurally (Becker, a., & Bieswanger, M. 2004). Similar to words, the meaning in sentences can be analyzed by looking at the relationship of meaning between one sentence and another sentence. now we examine the types of meaning relationships between sentences as follows.

- **Presupposition**

Presupposition is the relationship of meaning between sentences that occurs because of background knowledge of a situation shared by interlocutors in a communication. Background knowledge determines the form of sentences produced by a speaker and understood by his/her listener. In other words, presupposition refers to the background knowledge that is considered to be the cause of a speaker making particular sentences and contributes meaning comprehension to a listener (natkare, B. 2015).for example, a conversation is taking place between Adam and Hawa on campus.

sentences:

Adam: How about inviting Elli. She could join us to study together this afternoon.

Hawa: Yes, let's do that. she can give andy a ride too.

t here are at least three presuppositions derived from the sentences:

- a. adam and Hawa know e lli and andy
- b. Elli has a car or a motorcycle
- c. andy does not have a vehicle (a car or a motorcycle)

A simple illustration of presupposition would be provided like this: We have A (background knowledge) before saying B (sentences).

- **Entailment**

Entailment is the relationship of meaning between two sentences that occurs because of the existence of a logical linguistic structure in both sentences or the meaning of the second sentence already includes in the first sentence (crane, l. B., Yeager, e., & whitman, r. l. 1981). logical linguistic structure means that if the first sentence is true, then the second sentence must be true. The truth of the two sentences can be seen from the existence of a lexical relationship, for example:

a: andy is an english teacher.

B: He can teach english grammar.

The example indicates that A entails B because the truth of A needs the truth of B. andy is an english teacher, then he can teach english grammar. If andy is not an English teacher, then he will not be able to teach English grammar. english teacher and teach english grammar have lexical relationship in which english entails english grammar and teacher entails teach.

To illustrate entailment, we can use this basic rule. If sentence A and sentence B are connected by entailment, then it means if A is true, then B must be true as well. On the contrary, if A is false, then B must also be false.

- Paraphrase

Paraphrase is the relationship of meaning between two sentences that occurs because the two sentences are considered to have identical meanings but they have differences in either lexical items or syntactic structures. there are three possible ways to produce paraphrase, namely:

a. to replace one or more words in the second sentence with the most relevant synonyms of the word(s). to know the most relevant synonyms for a word, we should visit a thesaurus website at <https://www.thesaurus.com/>, for example:

- They like reading books on linguistics
 - they *enjoy* reading books on linguistics
- } Pairs of paraphrases

b. to change the lexical structure of a phrase in the second sentence, for example:

- They like reading books on linguistics
 - they *enjoy* reading *linguistics books*
- } Pairs of paraphrases

c. to change the sentence structure, (e.g. from active to passive sentence), for example:

- They bought linguistics books
 - Linguistics books were bought by them
- } Pairs of paraphrases

If we notice the examples above, we can clearly see that each pairs of sentences indicate similarity in meaning after the second sentence of each pair experiences word substitution for synonym (a), lexical restructuring in phrase (b), and alternation of sentence structure (c).

- **Contradiction**

Contradiction is the relationship of meaning between two sentences established because the two sentences have opposite meanings which contain contradictory information. contradictory information means that the meanings of the two sentences do not support each other. In other words, if the meaning of the first sentence is true, then the meaning of the second sentence must be contrary to the truth in the first sentence. Therefore, the meanings of the two sentences are called contradiction. for example,

a: adam is the only child

B: adam's sister is called Hawa

If we notice the information contained in both sentences, we find that the information is contradictory because if it is true that Adam is the only child, then it cannot be true that he has a sister as it is impossible for an only child to have a sister or a brother.

3. Interpretation of Words, Phrases and Sentences

In addition to having meanings, words and sentences also have interpretations. Interpretation, in this case, refers to the act explaining the meaning of a particular word or sentence. Often in social life, we find words or sentences that are not easily understood without being interpreted. To understand the meaning of the words or sentences correctly, an effort to explain their meanings is required. Two obvious cases of interpretations in semantics are ambiguity and speech acts. The two cases are respectively discussed in this sub-section.

3.1. Ambiguity

In semantics, ambiguity is a term used to indicate a linguistic phenomenon in which a word, a phrase, or even a sentence has more than one meaning and requires multi-interpretations. consequently, interlocutors often face problems in understanding the intended meaning the word, phrase, or the sentence. Therefore, a word, for example, is said to be ambiguous if the word can be interpreted in more than one meaning. So don't be surprised if in our social interactions, we sometimes find ambiguous series of words, phrases and sentences, just because a number of words have more than one meaning or the use of different syntactic structures in the same string of words, phrases and

sentences. In general, ambiguity can be categorized into two sub-categories, i.e. lexical ambiguity and syntactical ambiguity.

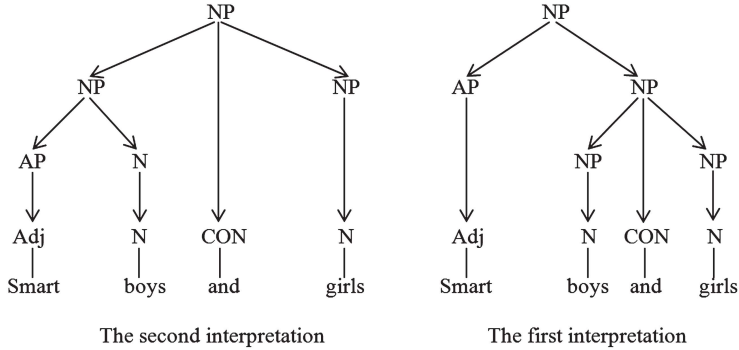

- **Lexical Ambiguity**

Lexical ambiguity occurs when we use a word and the word has two or more possible meanings which makes it in need of multiple interpretations. A word may carry two or more possible meanings because of two factors, i.e. homophony and polysemy. Homophony (the same sound but different spelling and meaning) can make a word interpreted in more than one meaning. For example, a man and his family members walk along the beach, his wife suddenly says something that sounds “lɒk æt ðə sʌn”. The man may think what does his wife want him to look at ‘the son’ or ‘the sun’? The word [sʌn] sounds ambiguous to the man because it can be interpreted as ‘son’ or ‘sun’ in that context. Besides, polysemy (sounded and spelled alike but have different meaning) can also make a word interpreted in more than one meaning. for example, ‘Adam went to the bank’. The word ‘the bank’ in the sentence may be interpreted either as ‘a financial institution’ (Adam went to a financial institution) or ‘the land alongside a river’ (adam went to a river). even though lexical ambiguity potentially causes problems in grasping meanings in word level, interlocutors can look at the context for facilitating them to understand the intended meaning of a word. For example, “Adam went to the bank yesterday morning. He wanted to save his money there” The bank in this context must refer to a financial institution.

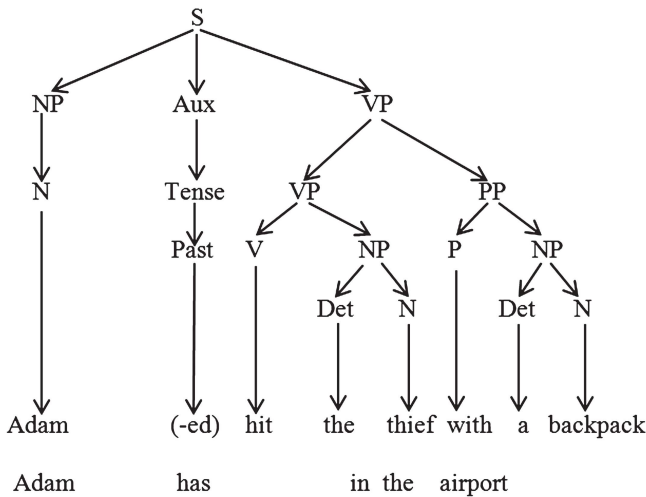

- **Syntactical Ambiguity**

In addition to lexical ambiguity, it is also important to learn syntactical ambiguity. Syntactical ambiguity refers to a semantic phenomenon, in which a phrase or a sentence has two or more possible meanings(ambiguous) because of its syntactic structure. In other words, a phrase or a sentence is syntactically ambiguous not because it has an individual word that has more than one meanings, but because the syntactic structure of the phrase or the sentence establishes more than one possible meaning (multi-interpretations). In phrase level for example, a syntactic ambiguity can occur as in a phrase “smart boys and girls”. If we notice the phrase, we have two interpretations. The first, smart can be understood as the property of the boys and the girls. The

second, it can be interpreted as the property of the boys alone. The different interpretations caused by the phrase can be illustrated by using the following underlying structures:

However, syntactical ambiguity not only takes place in phrase level, but also occurs in sentence level. Take this sentence as an example: “Adam hit the thief with a backpack”. If we notice the sentence, we will differently interpret it in two meanings. In the first interpretation, the prepositional phrase ‘with a backpack’ functions to modify the verb ‘hit the thief by using a backpack’, that the sentence’s intended meaning is “Adam used the backpack to hit the thief”. The second possible interpretation, the prepositional phrase ‘with a backpack’ functions to modify the noun ‘thief’, that the sentence’s intended meaning becomes “Adam hit a thief who had a backpack”. Both interpretations of the sentence can be seen in the following structures:

The first interpretation : Adam used a backpack to hit the thief

The second interpretation : Adam hit the thief who had a backpack

In regard to meaning interpretations, Lobner, S. (2002) is of the opinion that our knowledge of words and syntactic structures are never enough to interpret English sentences because there are still some other social factors involved in sentence interpretation, such as our beliefs, attitudes, as well as cultural norms and values. Therefore, the following sub section illustrates how those factors work in sentence interpretation by focusing its discussion on another semantic phenomenon that is speech act. Speech act is briefly discussed as follows.

3.2. Speech act

Speech act has become one alternative approach to meaning interpretation in human language. A speech act may be defined as an expression used by a speaker where the expression not only presents information, but also presents an action or function such as thanking, apologizing, requesting, ordering, inviting, complaining, refusing, warning, or congratulating. For example, an expression “I would like a cup of coffee, is there any?” is considered as a speech act because the expression not only gives us information that the speaker wants a cup of coffee, but also carries out a function as a request. In other words, speech act helps us to recognize something more than simply identifying the intended meaning of a sentence, but it goes beyond the border to identify the function of the intended meaning. The speaker’s question “is

there any?” can be interpreted as “can someone give me a cup of coffee?” which performs function as a request.

When talking about speech act, we should not be apart from talking about the speech act theory that was firstly introduced by John Langshaw Austin (1962). according to austin (1975), all utterances perform actions which can be categorized into three kinds of acts, i.e. Locutionary act, Illocutionary act, as well as Perlocutionary act.

- Locutionary act

The locutionary act refers to the actual sentence uttered by a speaker with a particular meaning (a sentence with its literal meaning or meaningful linguistic expression) which is clearly understood by the speaker’s listener. For example, if a child is saying “cool this evening”, this utterance carries out the function of locutionary act because the child is really talking about the weather that evening, nothing else.

- Illocutionary act

The illocutionary act refers to the possible intended meaning that a speaker has in uttering his/her sentences. for example, if a man is saying “cool this evening”, this utterance can be interpreted as a request to close the window, or as an order to take a jacket for him, or even as a complaint to the cool weather.

- Perlocutionary act

Perlocutionary act refers to the intended meaning which is understood by the listener and affects on his/her action. For example, the utterance ‘cool this evening’ is understood by the listener as a request to close the window. then this meaning effects the listener’s action to close the window immediately.

In addition to the speech act categories, we can also examine the interpretation of a sentence by considering the relationship between the linguistic structure used in the sentence and the function. If the linguistic structure of a sentence has a direct relationship to the function carried out by the sentence. The speech act is then called a direct speech act. for example, a speaker is using an interrogative structure to as a question, e.g. “Can you speak English?” However, if the linguistic structure has nothing to do with the function of the sentence, then it is called an indirect speech act. for example, a speaker is using an interrogative structure not to ask a question but, to make a request, e.g. “Can you show me the way to the bus station?”

About the Author

Kaharuddin is a lecturer in English language teaching and linguistics at the English Education Department, Faculty of Education and Teacher Training, Universitas Islam Negeri (UIN) Alauddin Makassar. He finished his undergraduate in Social and Political Science in 1999 at Universitas Hasanuddin (UnHas) Makassar. One year later, he attended a postgraduate program in English

language studies (ELS) at the university and received his Magister degree (M.Hum) in 2004. Following the graduation, he attended UnHas again in 2009, on a scholarship from the Directorate General of Higher Education of the Republic of Indonesia (Beasiswa DIKTI) and received his Doctoral degree (Dr) in Applied Linguistics in 2014. His research interest is focused not only on English education but also on linguistics. He has written not only some international journals (e.g. on Syllabus design, Needs analysis, ELT materials development, ELT methods, and Speech acts), but also some books (e.g. *The Communicative Competence Based English Language Teaching: Teaching Speaking Courses through CLT* -2013, *The Communicative Grammar Translation Method: An Integrated Method of CLT and Grammar Translation for Teaching English Communicatively and Accurately*-2013, *Interactional Speaking: A Guide to Enhance Natural Communication Skills*-2014,

Transactional speaking: a guide to Improve Transactional Exchange skills in English for group discussions and Interviews-2014, the art of developing speaking as a Performance: Promoting Formal Uses of Public Speaking skills in English for Making Speeches and Oral Presentations-2015, Syllabus Design for English Language Teaching-2016, the essential of discourse analysis for teaching English as a foreign language-2017, discourse analysis for EFL - 2018, Phonetics for Indonesian Learners of English: an essential guide to Natural English Pronunciation-2018. His most recent book is Introduction to linguistics: Understanding the Basic Theory-2019. He is now a reviewer of International Journal of English Language Education at Macrothink Institute, Nevada, Las Vegas, United States of America (USA).

INTRODUCTION TO LINGUISTICS

UNDERSTANDING THE BASIC THEORY

Many college and university students who study English language in Indonesia still find it difficult to read and to understand books on Linguistics which are written by well-known linguistics authors such as L. Ben Crane, Edward Yeager, Randal L Whitman (1981), John Lyons (1981), Stuart C. Poole (1999), Alan Davies (2007), Daniela Isac & Charles Reiss (2008), Charles F. Meyer (2009), Andrew Radford, Martin Atkinson, David Britain, Harald Clahsen & Andrew Spencer (2009), as well as Kirk Hazen (2014). Consequently, the students can only gain a limited understanding of linguistics. The fact has inspired the author to write this introductory textbook on linguistics. This work is written for two main purposes, namely:

- To provide the students majoring in English language with a linguistics book written in English that is not too difficult to understand.
- To give adequate explanations about basic, comprehensive descriptions of language and linguistics.

Since the attainment of the purposes (especially the second one) is crucially important that the content of this book attempts to cover all considerable details of language and linguistics, which is meant to introduce the students to the core and central concepts of the fields, addressing:

- Communication and language in human's social lives
- The relationship between language and linguistics
- The major elements in linguistics i.e. Phonetics, Phonology, Morphology, Syntax, and Semantics

The selection of those materials is based on the author's experiences of teaching linguistics at the English education department for more than thirteen years, some useful discussions of linguistics issues with his fellow lecturers, as well as classroom interactions with his students. Those things are very valuable for making this work come into reality.[]
