Abstract

The advancement of technology encourages the education sector to integrate it into learning design. By incorporating technology into the learning process, students not only gain access to sophisticated tools for understanding and managing mathematical concepts but also enhance their ability to communicate mathematical ideas clearly and effectively. This integration supports the development of students' mathematical communication skills. Therefore, prospective elementary school teachers must prepare themselves to meet the challenges of education in an increasingly digital era. This study aims to analyze the effectiveness of technology integration in learning design to improve the mathematical communication skills of students of the Elementary Madrasah Teacher Education Study Program (PGMI) concerning the concept of integers. The research employs a quantitative approach using a quasi-experimental method with a posttest-only control design. The sample for this study consisted of 74 PGMI students, divided into an experimental group of 38 students and a control group of 36 students. The experimental group received instruction that integrated technology, while the control group utilized conventional teaching methods. Data was collected through a mathematical communication skills test. Data analysis involved both descriptive and inferential statistics, specifically the independent sample t-test. The results indicated significant differences in the mathematical communication skills of the experimental group compared to the control group. The integration of technology in learning has proven effective in enhancing students' mathematical communication skills regarding the topic of integers.

Keywords: *Technology integration, Mathematical Communication Skills, Learning Design*

Commented [user1]: Suggestions for Improvement: Title Refinement:

The title is informative but could be more concise:
"Integrating Technology to Enhance PGMI Students' Mathematical Communication Skills on Integers".

Introduction/Background:

While the abstract introduces the importance of technology in education, it could briefly specify the type of technology integrated (e.g., specific software, digital tools).

The link between technology and mathematical communication skills could be elaborated slightly to strengthen the rationale.

Methodology Details:

It is helpful that the abstract mentions the "posttest-only control design," but briefly stating why this design was chosen could add clarity.

Mentioning how mathematical communication skills were measured (e.g., through problem-solving, written explanations) would provide more context.

Findings Description:

The abstract concludes that there were "significant differences," but it could specify the nature of the improvements. For instance, did students in the experimental group demonstrate better problem-solving explanations, more accurate use of terminology, or improved logical reasoning?

Implications:

Adding a sentence on the practical implications of these findings (e.g., recommendations for curriculum development or teacher training) would enhance the abstract's value.

Abstrak

Kemajuan teknologi mendorong sektor pendidikan untuk mengintegrasikannya ke dalam desain pembelajaran. Dengan menggabungkan teknologi ke dalam proses pembelajaran, mahasiswa tidak hanya memperoleh akses ke perangkat canggih untuk memahami dan mengelola konsep matematika tetapi juga meningkatkan kemampuan mereka untuk mengomunikasikan ide-ide matematika dengan jelas dan efektif. Integrasi ini mendukung pengembangan keterampilan komunikasi matematika mahasiswa. Oleh karena itu, calon guru sekolah dasar harus mempersiapkan diri untuk menghadapi tantangan pendidikan di era yang semakin digital. Penelitian ini bertujuan untuk menganalisis efektivitas integrasi teknologi dalam desain pembelajaran untuk meningkatkan keterampilan komunikasi matematika mahasiswa Program Studi Pendidikan Guru Madrasah Dasar (PGMI) pada konsep bilangan bulat. Penelitian ini menggunakan pendekatan kuantitatif dengan menggunakan metode quasi eksperimen dengan desain kontrol posttest-only. Sampel penelitian ini terdiri dari 74 mahasiswa PGMI, yang dibagi menjadi kelompok eksperimen sebanyak 38 mahasiswa dan kelompok kontrol sebanyak 36 mahasiswa. Kelompok eksperimen menerima pembelajaran yang mengintegrasikan teknologi, sedangkan kelompok kontrol menggunakan metode pengajaran konvensional. Data dikumpulkan melalui tes keterampilan komunikasi matematika. Analisis data melibatkan statistik deskriptif dan inferensial, khususnya uji-t sampel independen. Hasil penelitian menunjukkan adanya perbedaan yang signifikan dalam keterampilan komunikasi matematis kelompok eksperimen dibandingkan dengan kelompok kontrol. Integrasi teknologi dalam pembelajaran terbukti efektif dalam meningkatkan keterampilan komunikasi matematis siswa terkait topik bilangan bulat.

INTRODUCTION

The ever-growing digital era has made the integration of technology in education a necessity rather than merely an option (Akbar Iskandar, et al., 2024). The incorporation of digital technology into the learning process brings about significant changes in educational methods. By leveraging digital tools, students can engage in a more immersive learning experience (Zaiyad Namiri, et al., 2023). Especially In the discipline of mathematics education, where technology can create new opportunities to enhance learning effectiveness.

The rapid development of technology today means that all parties in the world of education must be able to keep up with and follow the technological advances that are occurring (Maritsa et al., 2021). Therefore, it is important for teachers and prospective teachers including PGMI students to understand and master technology well in order to be able to use it effectively in the learning process (Musa'ad, F. et al., 2023). By integrating technology into education, both teachers and students will find it easier to keep up with technological advances (Layn, MR et al., 2022). This application also has a major impact on teaching methods, thus opening

Commented [user2]: Suggestions for Improvement: Conciseness and Redundancy:

Several sentences repeat similar ideas, particularly regarding the importance of technology and its benefits. For example: "The rapid development of technology today means that all parties in the world of education must be able to keep up with and follow the technological advances that are occurring."

"By integrating technology into education, both teachers and students will find it easier to keep up with technological advances."

Combining these ideas into a single, concise statement would improve readability.

Flow and Organization:

The introduction jumps between topics (e.g., the role of technology, mathematical communication skills, and prior research) without a clear progression. Organizing it into distinct sections (e.g., "Role of Technology," "Mathematical Communication Skills," "Research Gap and Objectives") would enhance clarity.

Avoid Overloading with References:

The introduction cites numerous studies, but not all are elaborated on. For example, mentioning too many studies in quick succession (e.g., "Windasari et al., 2024; Idayanti et al., 2024; Irpan Siregar et al., 2024") can overwhelm the reader. Focus on a few key studies that directly support the research objective.

Clarity in Definitions:

While mathematical communication is defined, some terms like "digital tools" and "technology integration" could be more specific (e.g., what types of digital tools or platforms were considered?).

Objective Statement:

The research objective should appear earlier in the introduction. Currently, it is introduced near the end. Positioning it earlier would help readers better understand the focus of the study.

Grammatical and Stylistic Refinements:

Some sentences could be rephrased for improved clarity and readability. For example:

Original: "The existence of a correlation between concepts in mathematical material necessitates that students be able to explain both the relationships and differences among these concepts."

Revised: "Students must be able to explain the relationships and distinctions between mathematical concepts to understand their interconnections."

up opportunities for learning more interactive and effective (Trisnawati, N. F & Warfandu, S, 2022).

Mathematics is an important subject that must be taught to all students, from elementary school to college level. The goal is to develop logical, analytical, structured, and critical thinking skills (Mulyati & Evendi, 2020). According to Fadilla et al. 2021, mathematics is a discipline characterized by unique features and consists of logically structured concepts, with relationships governed by valid proofs. Today, the integration of technology in education is essential, as it can significantly enhance learning methods and foster the development of mathematical ability in a more effective and interesting way (Setyo, AA et al., 2023).

The existence of a correlation between concepts in mathematical material necessitates that students be able to explain both the relationships and differences among these concepts. This ability is a crucial component of communication skills. Mathematical communication skills are essential competencies that PGMI students must develop. These skills encompass the

ability to express and interpret mathematical ideas both verbally and in writing, utilizing various forms such as tables, diagrams, pictures, formulas, or demonstrations (Anggriani & Septian, 2019; Soleh et al., 2020). Mathematical communication is articulated in both written and oral forms, demonstrating clarity in the presentation of ideas and concepts within mathematical content (Hodiyanto, 2017). Furthermore, mathematical communication skills are characterized by the ability to express mathematical ideas and concepts in a logical sequence (Mhd Khorul Aulia & Edy Surya, 2023). The indicators used to assess students' mathematical communication skills are based on the Mathematical Communication Standards proposed by the National Council of Teachers of Mathematics (NCTM) in 2000. The specific indicators of mathematical communication skills used in this study are:

- 1) Consolidating mathematical ideas or concepts in writing.
- 2) Interpreting mathematical ideas or concepts through graphs, images, or tables.

3) Accurately expressing mathematical concepts.

The importance of communication skills extends beyond personal understanding; it's crucial for preparing future educators to explain mathematical concepts clearly and effectively to elementary school students. However, studies have shown that students exhibit low written communication skills when solving mathematical problems (Nadlifah & Prabawanto, 2017; Paridjo & St. Budi Waluya, 2017; Turmuzi & Kurniawan, 2021). Therefore, the development of mathematical communication skills in mathematics education must be continuously pursued in higher education. One effective approach is to integrate technology into the learning design.

The emergence of technology-based media is anticipated to offer solutions to various challenges encountered in the field of education (Windasari et al., 2024). Tools such as e-learning platforms, educational applications, and other digital resources have become essential tools in supporting the learning process in this digital era (Idayanti et al., 2024). Numerous studies have shown the effectiveness of integrating

technology into education. For instance, research conducted by Irpan Siregar et al. in 2024 (Irpan Siregar et al., 2024) revealed that technology significantly enhances the effectiveness and efficiency of learning. Additionally, a study by Vera Dewi K.O. and Nilam Sari in 2019 (Vera Dewi K.O. & Nilam Sari, 2019) indicated that the incorporation of technology in education positively impacts students' mathematical communication skills. Furthermore, research by Eyus and colleagues in 2021 (Eyus Sudihartinih et al., 2021) showed that the use of digital technology in Basic Mathematics courses can improve students' ability to understand concepts and problem-solving abilities, thereby enhancing their overall learning outcomes.

Based on this background, this study aims to explore how the integration of technology in learning design can enhance the mathematical communication skills of PGMI students, particularly in understanding and explaining the concept of integers. This research will investigate various strategies and innovative approaches for incorporating technology into the PGMI curriculum, as well as analyze its impact on the development of students

mathematical communication skills. By understanding how technology can be effectively integrated to support the

Group	Treatment	Posttest
Experiment	X	T
Control		T

enhancement of these skills, this study aims to better prepare prospective elementary school teachers to face the challenges of education in the digital era. The findings of this research can serve as a foundation for developing a more effective PGMI curriculum that equips future teachers to teach mathematics in the digital era, while also providing valuable insights for educators and policymakers to improve the quality of mathematics education at the higher education level.

METHOD

This research employs a quantitative research type with a quasi-experimental method. This design has a control group, but cannot fully function to control external variables that influence the implementation of the experiment (Sugiyono, 2014).

The sample in this study consisted of 74 PGMI students, including two classes: one control class with 36 students and one

experimental class with 38 students, all selected purposively. The design used was a posttest-only control design which is described in table 1 below.

Table 1. Research design

The independent variable in this study is the integration of technology into learning design, while the dependent variable is mathematical communication skills, specifically focusing on the concept of integers. The research instruments utilized include tests for mathematical communication skills, observation sheets, and student response questionnaires.

The concept presented in this study focuses on the subtopic of integers. The pretest and posttest questions are identical. The integration of technology in learning design includes digital media such as YouTube, Kahoot, and PhET.

The procedure involves the preparation of instruments, the implementation of learning with various treatments in both experimental and control groups, and the collection of data through pretest and posttest. Data analysis employs descriptive and inferential statistics, including prerequisite tests for

Commented [user3]: Where is the table?

normality and homogeneity, as well as hypothesis tests such as the independent t-test or Mann-Whitney U test.

RESULTS AND DISCUSSION

Result

This study descriptively examines the mathematical communication skills of PGMI students regarding the concept of integers. It compares those who received technology-integrated learning with those who experienced conventional learning, followed by inferential statistical tests to validate the findings.

a. Description of PGMI Student's Mathematical Ability Results

Based on the research results, the posttest values obtained for the control group, which utilized conventional learning methods, and the experimental group, which employed technology-integrated learning for the concept of integers, are presented in Tables 2 and 3:

Tabel 3. Descriptive Statistics of Experiment Class Posttest

Statistics	Posttest
Minimal Score	65,00
Maximal Score	100,00
Average	80,26
Standard Deviation	6,77

Table 2. Descriptive Statistics of Control Class Posttest

Statistics	Posttest
Minimal Score	60.00
Maximal Score	91.00
Average	64.33
Standard Deviation	5.63

Based on tables 2 and 3 above, it shows that the mathematical communication skills of PGMI students in

Commented [user4]: Theoretical Gap
The study addresses a clear theoretical gap: the limited research on integrating technology into learning for improving mathematical communication skills, particularly among PGMI (Primary School Teacher Education) students. While previous studies have examined the general impact of technology on learning, this research specifically focuses on the concept of integers—an area often underexplored in technology-based interventions. It also identifies a gap in applying narrative-based problem-solving exercises to gauge communication skills, an essential aspect of mathematics education that blends conceptual understanding with articulation.

However, the discussion does not deeply engage with broader theoretical frameworks, such as constructivist learning theories or cognitive load theory, which could strengthen the foundation of the research. A deeper exploration of why technology integration benefits mathematical communication—beyond descriptive statistical improvements—would add depth to the theoretical gap analysis.

Research Findings
The findings of this study are robust and reveal several key points:

Quantitative Results:
Students in the experimental group (technology-integrated learning) outperformed those in the control group (conventional methods) significantly, with a mean score difference of 15.93 points. The experimental group showed higher levels of proficiency, with no students in the "very low" or "low" categories, and a notable proportion (50%) in the "high" category. An effect size of 2.551 indicates a very large impact, reinforcing the effectiveness of the intervention.

Inferential Statistics:

The use of independent samples t-tests confirmed the statistical significance of the difference between the two groups, validating the impact of technology integration.

Challenges Identified:

Despite improvements, some students in both groups struggled with narrative-style questions and application tasks, pointing to an area where the intervention was less effective.

Implementation Challenges:

Familiarity with tools like PhET simulations and adapting to digital interfaces posed initial hurdles for students.

Novelty
The study contributes novel insights in several ways:

Context-Specific Focus:

the control class are relatively low, with an average score of 64.33 from a sample size of 36. The lowest score recorded is 60, while the highest is 91, resulting in a standard deviation of 5.63. In contrast, the mathematical communication skills of PGMI students in the experimental class are significantly higher, with an average score of 80.26 from a sample size of 38. The lowest score in this class is 65, and the highest is 100, yielding a standard deviation of 6.77. Comparing the two posttest scores, it is evident that the average score in the experimental class exceeds that of the control class by 15.93 points. Additionally, the lowest score in the experimental class is 5 points higher, and the highest score is 9 points higher than those in the control class.

Student mathematical communication skills are categorized into five levels: very low, low, medium, high, and very high. The frequencies and percentages obtained from the post-test are as follows:

Table 4. Results of Mathematical Communication Ability in Control Class

Interval	Category	Posttest	
		Frequency	Percentage (%)
0 – 54	Very low	0	0
55 – 64	Low	14	39
65 – 79	Medium	21	58.3
80 – 89	High	0	0
90 – 100	Very high	1	2.7
Total		36	100

Table 5 Results of Mathematical Communication Ability in Experimental Class

Interval	Category	Posttest	
		Frequency	Percentage (%)
0 – 54	Very Low	0	0
55 – 64	Low	8	21
65 – 79	Medium	14	37
80 – 89	High	19	50
90 – 100	Very high	5	13
Total		38	100

Based on tables 4 and 5 above, it can be seen that the posttest scores for the mathematical communication skills of PGMI students in the control class are dominated by the medium category with a percentage of 58.3%, there are 14 students in the low category with a percentage of 39% and there is 1 person in the very high category. with a percentage of 2.7%. While the posttest scores of PGMI students' mathematical communication skills in the experimental class are dominated by the high category with a percentage of 50%, there are 14 students in the medium category with a percentage of 37% and there are 5 students in the very high category with a percentage of 13% and none are in the very low or low categories.

Comparison results of posttest of students between the control class and the experimental class can be seen in Figure 1 below:

In this section, the effectiveness of

Figure 1. Results of the posttest of mathematical communication skills

Based on the analysis results, it can be concluded that there is a significant difference in the average mathematical communication skills of PGMI students between classes that utilize technology-integrated learning and those that employ conventional learning methods.

b. The effectiveness of learning with technology integration in improving mathematical communication skills of PGMI students

integrating technology into learning will be evaluated by examining whether there is a significant difference in students' mathematical communication skills between those in the experimental class and those in the control class. The data analysis employed will be inferential analysis.

The statistical method employed in this study is the independent samples t-test. This test is conducted to evaluate specific hypotheses. Prior to performing the

independent samples t-test, prerequisite analyses were conducted, including tests for data normality and homogeneity of variance. Utilizing IBM SPSS version 29, the results indicated that the data were normally distributed, with a significance value (sig) greater than 0.05 ($0.08 > 0.05$), and that the variances were equal, as evidenced by a significance value (sig) greater than 0.05 ($0.169 > 0.05$).

After passing the normality and homogeneity tests, an inferential analysis was conducted using an independent samples t-test on the posttest results of both classes: the experimental class and the control class. The analysis yielded the following data:

Table 6. Independent Samples Test

Independent Samples Test											
		Levene's Test for Equality of Variances			t-test for Equality of Means						
		F	Sig.	t	df	Significance		Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
						One-Sided p	Two-Sided p			Lower	Upper
Hasil Posttest	Equal variances assumed	1.930	.169	-10.969	72	<.001	<.001	-15.9298	1.4523	-18.8249	-13.0347
	Equal variances not assumed			-11.024	70.830	<.001	<.001	-15.9298	1.4451	-18.8113	-13.0483

Based on the results of the SPSS test

Information	Cohen's d Estimate Value
Posttest Results	2,551

above, since the significance value (sig) is less than alpha ($\alpha = 0.001 < 0.05$), it can conclude that there is a significant difference in the mathematical communication skills of PGMI students regarding the concept of integers between classes taught using technology-integrated learning and those taught using conventional methods.

using IBM SPSS version 29 to assess the effectiveness of technology integration in the learning design.

Table 7. Independent sample effect size

The calculation of the effect size for technology integration in learning design, aimed at enhancing the mathematical communication skills of PGMI students, yielded an effect size value of 2.551. This result categorizes the effect as "very large". This showing that integrating technology into learning design significantly improves the mathematical communication skills of

PGMI students, particularly in the area of integers.

Based on the results of the effectiveness test and the effect size test, the integration of technology in the learning design has proven to be effective and has a significant impact on improving the mathematical communication skills of PGMI students in the area of integers.

Discussion

The results of the analysis regarding the implementation of technology-integrated learning indicated that it was successful in both average performance and proportion. However, some students still faced challenges in solving integer problems, particularly when the questions were presented in narrative form and differed from the examples provided, both in the experimental and control groups. This also suggests that students' mathematical communication skills related to sub-integers have not yet developed adequately over the course of one semester. Furthermore, from the perspective of learning factors, the enhancement of mathematical communication skills among PGMI students utilizing technology-

integrated learning remains suboptimal, as several obstacles were encountered during implementation. Therefore, it is essential to further innovate technology-integrated learning by addressing the findings of this study.

The results of the study described above indicate that students who engage in technology-integrated learning demonstrate greater improvement in mathematical communication skills compared to those who receive conventional instruction. This suggests that technology integration positively impacts the enhancement of students' mathematical communication abilities. Supporting this finding, research conducted by Rika Sukmawati and Kus Andini Purbaningrum (2023) highlights the effectiveness of using Learning Management Systems (LMS) in blended learning environments to enhance students' mathematical communication skills. Similarly, Bahri (2020) also found in his research that the use of e-learning in learning process can improve students mathematical communication skills. Additionally, Minatun Nadlifah and Octavina Rizky Utami Putri (2023) revealed

that the incorporation of technology in education influences students mathematical communication skills. Therefore, technology-integrated learning is an effective approach for enhancing the mathematical communication skills of PGMI students, particularly in the context of integers.

Implication Of Research

Learning through effective technology integration can enhance the mathematical communication skills of PGMI students in the area of integers. The implications of this study suggest that further research should focus on other technology-integrated learning designs that can help students improve their mathematical communication skills and other competencies.

Limitation

The limitations of this research include the fact that the concept presented is solely in the form of integers, students are not yet familiar with the PhET web interface, and the exploration of integrating technology into education is still restricted to digital media.

CONCLUSION

The study's findings include the following conclusions: (1) the average mathematical communication ability of students using conventional learning was measured at a posttest score of 64.33, with a standard deviation of 5.63; (2) the average mathematical communication ability of students utilizing technology-integrated learning was measured at a posttest score of 80.22, with a standard deviation of 6.77; (3) inferential statistical analysis obtained a sig value $< \alpha$ ($0.001 < 0.05$), and it was concluded that there was a significant difference in students mathematical communication skills using learning with technology integration. And the effect size results obtained were 2, 551 with a very large category. This means that learning with technology integration is effective in improving PGMI students mathematical communication skills on the concept of integers.

Commented [user5]: Implications and Next Steps
The implications of this study are significant:

Curriculum Design:

Technology-integrated learning should be emphasized in teacher education programs, particularly for improving foundational mathematical skills.

Future Research Directions:

Explore other innovative tools and methodologies to further enhance mathematical communication skills.

Investigate the scalability of the intervention in diverse educational settings and with different student demographics.

Professional Development:

Train educators in effectively utilizing technology in classrooms to maximize its impact on student outcomes.

Commented [user6]: Limitations

The limitations, such as focusing solely on integers and restricted exposure to digital media, highlight areas for refinement in future research. Expanding the scope and improving tool training can help address these challenges.

Commented [user7]: In conclusion, this study makes a valuable contribution to understanding the role of technology in mathematics education, particularly for PGMI students. By addressing theoretical gaps, offering strong empirical evidence, and highlighting areas for improvement, it lays the groundwork for future innovations in this domain.

Dear Suharti,

Congratulations on the acceptance of your submission, Technology Integration in Learning Design to Improve PGMI Students Mathematic Communication Skills on the Concept of Integers, to Kreano, Jurnal Matematika Kreatif-Inovatif. Now that your submission has been accepted, we would like to request payment of the publication fee.

This fee covers the production costs of bringing your submission to publication. To make the payment, please visit <https://journal.unnes.ac.id/journals/kreano/payment/pay/77>.

If you have any questions, please see our [Submission Guidelines](#)
